Direct and indirect DM searches

Several observations indicate existence of non-luminous Dark Matter (missing force) at very different scales! —» WIMPs

* Direct detection

DM particles streaming through the surface of the Earth could scatter with the nuclei of the detector

$$R \approx \frac{\rho_{\odot} \sigma \langle v \rangle}{m_{\chi} m_A}$$

Direct and indirect DM searches

Several observations indicate existence of non-luminous Dark Matter (missing force) at very different scales! —» WIMPs

* Direct detection

* Direct/Indirect detection

Flux of neutrinos \propto annihilation rate \propto Sun's capture rate
 \propto DM particles through the Sun \propto local DM density

$$\dot{N}_\chi(t) = C_\odot - A_\odot N_\chi^2(t) - E_\odot N_\chi(t)$$

$$C_\odot \approx 1.3 \times 10^{21} \text{ sec}^{-1} \left(\frac{\rho_{\text{local}}}{0.3 \text{ GeV/cm}^3} \right) \left(\frac{270 \text{ km/s}}{\bar{v}_{\text{local}}} \right) \times \left(\frac{100 \text{ GeV}}{m_\chi} \right) \sum_i \left(\frac{A_i (\sigma_{\chi i, SD} + \sigma_{\chi i, SI}) S(m_\chi/m_i)}{10^{-6} \text{ pb}} \right),$$

In order to extract particle physics parameters (m_x , σ , $\langle\sigma v\rangle$, τ ...) from DM experiments, the astrophysics (ρ_0 , $J \cdot \Delta\Omega$) has to be under control —» DM halo

DM: spherical halos?

N-body simulations favour Einasto and Navarro-Frenk-White profiles.

NFW

$$\rho(r) = \frac{4\rho_s}{r/r_s (1 + r/r_s)^2}$$

Einasto

$$\rho(r) = \rho_\odot \exp \left[-\frac{2}{\alpha} \left(\left(\frac{r}{r_s} \right)^\alpha - \left(\frac{R_\odot}{r_s} \right)^\alpha \right) \right]$$

$$\rho_0 = 0.3 \text{ GeV} / \text{cm}^3$$

$$r_s = 20 \text{ kpc}$$

$$\alpha = 0.38$$

DM: triaxial halos!

N-body simulations favour Einasto and Navarro-Frenk-White profiles.

Halos are found to be non-spherical.
In fact, spherical halos are rare!

Baryons prefer to lay in one of the 3 symmetry planes

NFW

$$\rho(r) = \frac{4\rho_s}{r/r_s (1 + r/r_s)^2}$$

Einasto

$$\rho(r) = \rho_{\odot} \exp \left[-\frac{2}{\alpha} \left(\left(\frac{r}{r_s} \right)^{\alpha} - \left(\frac{R_{\odot}}{r_s} \right)^{\alpha} \right) \right]$$

$$r_e^2 = x^2 + \left(\frac{y}{b/a} \right)^2 + \left(\frac{z}{c/a} \right)^2$$

$$a > b > c$$

Bolshoi simulation

Bolshoi A. Klypin, S. Trujillo-Gomez & J. Primack '10

Publicly available through the MultiDark Database K. Riebe et al. '11

Cubic volume $250 h^{-1}$ Mpc, sampled with 2048^3 particles

Mass of a simulation particle $1.4 \cdot 10^8 h^{-1} M_{\odot}$

Cosmological parameters compatible with WMAP5 and WMAP7

$$\Omega_m = 0.27, \Omega_{\Lambda} = 0.73, n_s = 0.95, h = 0.70, \sigma_8 = 0.82$$

Observational priors

Virial mass

Different methods like gravitational lensing, rotation curves, escape velocity, velocity dispersion profiles of some tracers...

Estimates based on stellar kinematics tend to yield $\leq 10^{12} M_*$

distant tracers tend to yield $\geq 10^{12} M_*$

M_V is expected to lie within $0.7 \cdot 10^{12} M_* < M_V < 4 \cdot 10^{12} M_*$

Observational priors

Virial mass

Mass at 60 kpc

Total mass in the innermost 60 kpc
Sloan Digital Sky Survey '08

$$M(<60 \text{ kpc}) = (4.0 \pm 0.7) \cdot 10^{11} M_*$$

If $\langle \rho_0 \rangle \sim 0.3 \text{ GeV}/\text{cm}^3$

the uncertainty $\sim 45\%$ @ 95% CL

Systematic uncertainties in $J \cdot \Delta\Omega$ Annihilation

a-b plane

a-c plane

b-c plane

$\langle J_{\text{ann}} \cdot \Delta\Omega \rangle \sim 14 (\text{GeV}/\text{cm}^3)^2 \text{ kpc sr}$
ROI = $20^\circ \times 20^\circ$ around the GC

uncertainty $\sim 10\%$ @ 95% CL

Systematic uncertainties in $J \cdot \Delta\Omega$

Decay

a-b plane

a-c plane

b-c plane

$\langle J_{\text{dec}} \cdot \Delta\Omega \rangle \sim 3.5 \text{ GeV/cm}^3 \text{ kpc sr}$
ROI = $20^\circ \times 20^\circ$ around the GC

uncertainty $\sim 20\%$ @ 95% CL

Conclusions

- * In order to extract particle physics parameters (m_x , σ , $\langle\sigma v\rangle$) from DM experiments, the astrophysics has to be under control.
- * N-body simulations predicts triaxial DM halos. Spherical halos are rare!
- * Using the DM only N-body simulation *Bolshoi* we studied the systematic uncertainties in ρ_0 and $J\cdot\Delta\Omega$ due to the halo asphericity.
- * We took into account observational priors (M_V , M_{60} , SD...) in order to make the halos more Milky way like.
- * For a standard NFW, deviations for $\rho_0 \sim 45\%$ and $J\cdot\Delta\Omega \sim 10\%$ (annihilation) and $J\cdot\Delta\Omega \sim 20\%$ (decay) @95% CL
ROI = $20^\circ \times 20^\circ$ around the GC
- * Non negligible effect for DM detection!
