Earth System

USRA, Earth System Science Education strategy, 2008

different earth system models

- Components:

ATM:

ICTP's RegCM (4.4.5.8)

OCN:

Rutgers Univ. ROMS (r737)

MIT, MITgcm (c63s)

RTM:

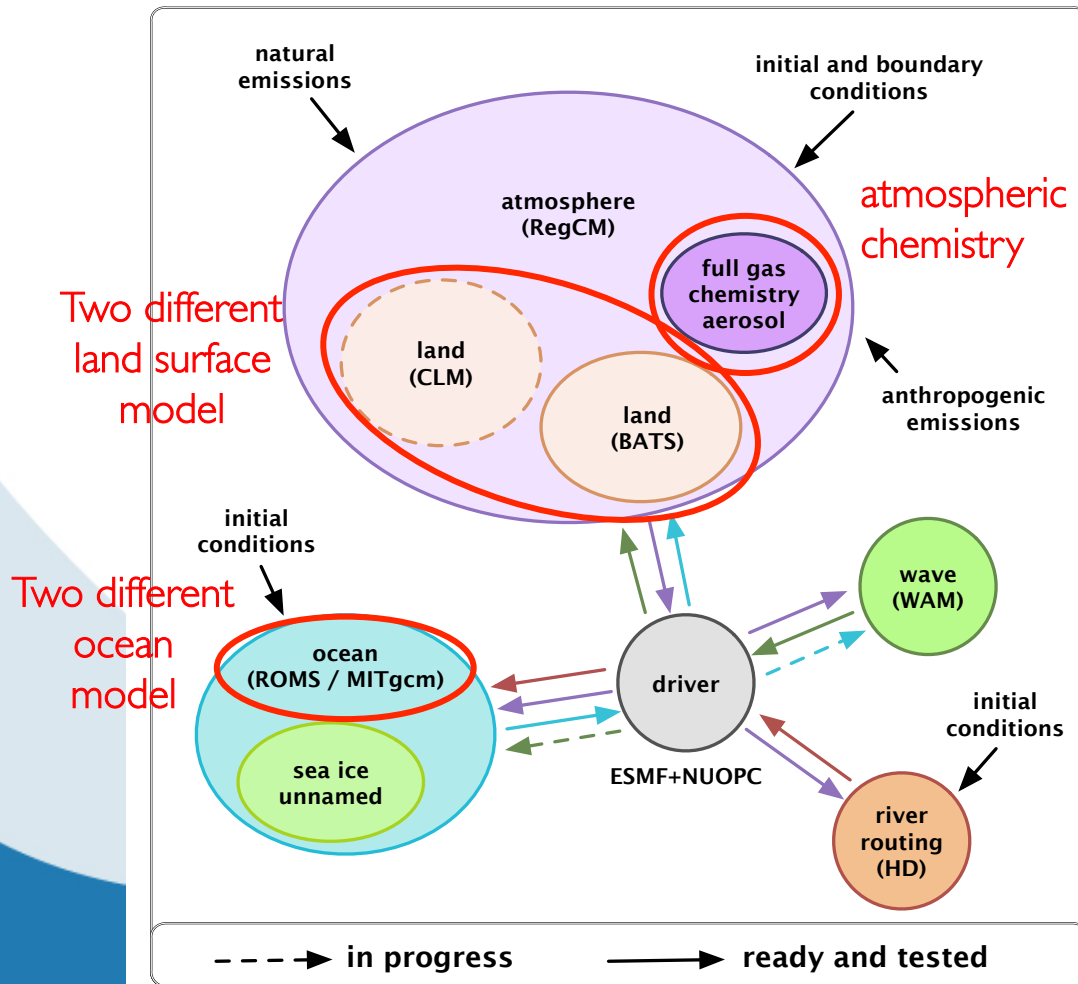

Max Planck's HD (mod. 1.0.2)

Ufuk U. Turunçoğlu

u.utku.turuncoglu@be.itu.edu.tr

Regional **E**arth **S**ystem **M**odel is coupled modeling system that allows using variety of different earth system models (**RegESM**)

- Components:

ATM:

ICTP's RegCM (4.4.5.8)

OCN:

Rutgers Univ. ROMS (r737)
MIT, MITgcm (c63s)

RTM:

Max Planck's HD (mod. 1.0.2)

WAV:

ECMWF's WAM (4.5.3 MPI)

DRV:

RegESM (7.0.0b38)

Managing Exchange Fields

- Exchange fields between model components are defined by extra configuration file (exfield.tbl)

6 atm2ocn T

```
taux: eastward_10m_wind_stress: bilinear: cross: u: N/m2: m2/s2: cf3: 0.0: F
tauy: northward_10m_wind_stress: bilinear: cross: v: N/m2: m2/s2: cf3: 0.0: F
psfc: surface_air_pressure: bilinear: cross: cross: mb: mb: 1.0: 0.0: F
swrd: shortwave_radiation: bilinear: cross: cross: W/m^2: Cm/s: cf2: 0.0: T
sflx: water_flux_into_sea_water: bilinear: cross: cross: kg/m^2s: m/s: 0.001: 0.0: T
nflx: surface_heat_flux: bilinear: cross: cross: W/m^2: Cm/s: cf2: 0.0: T
```

1 ocn2atm T

```
sst: sea_surface_temperature: bilinear: cross: cross: C: K: 1.0: 293.16: F
```

2 atm2rtm F

```
rnof: surface_runoff: bilinear: cross: cross: mm/s: m/s: 0.001: 0.0: F
snof: subsurface_runoff: bilinear: cross: cross: mm/s: m/s: 0.001: 0.0: F
```

1 rtm2ocn F

```
rdis: river_discharge: nearstod: cross: cross: m^3/s: m^3/s: 1.0: 0.0: F
```

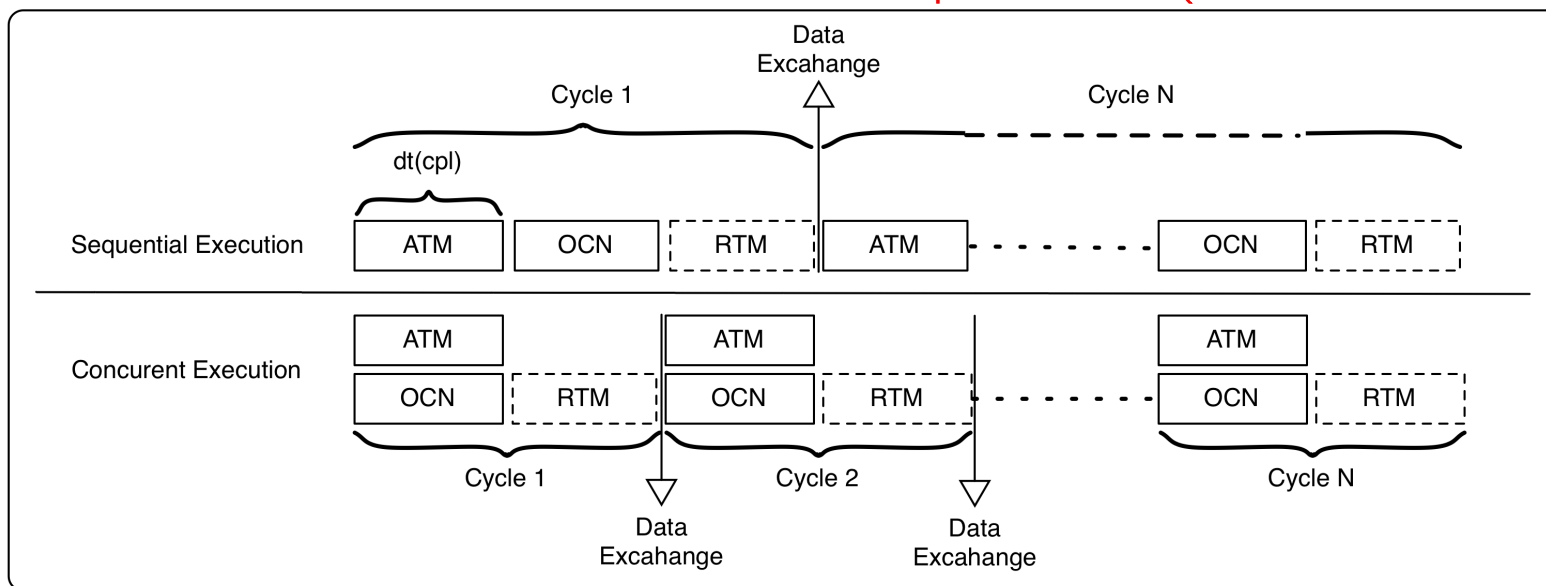

- The user can choose the exchange fields from the field pool

Sequential vs. Concurrent Execution

- RegESM also supports two different approach to run the model components.
 - Sequential:** model components are run in order
 - Concurrent:** all models are active at same time (it does not allow overlapping of the used cores / CPUs)

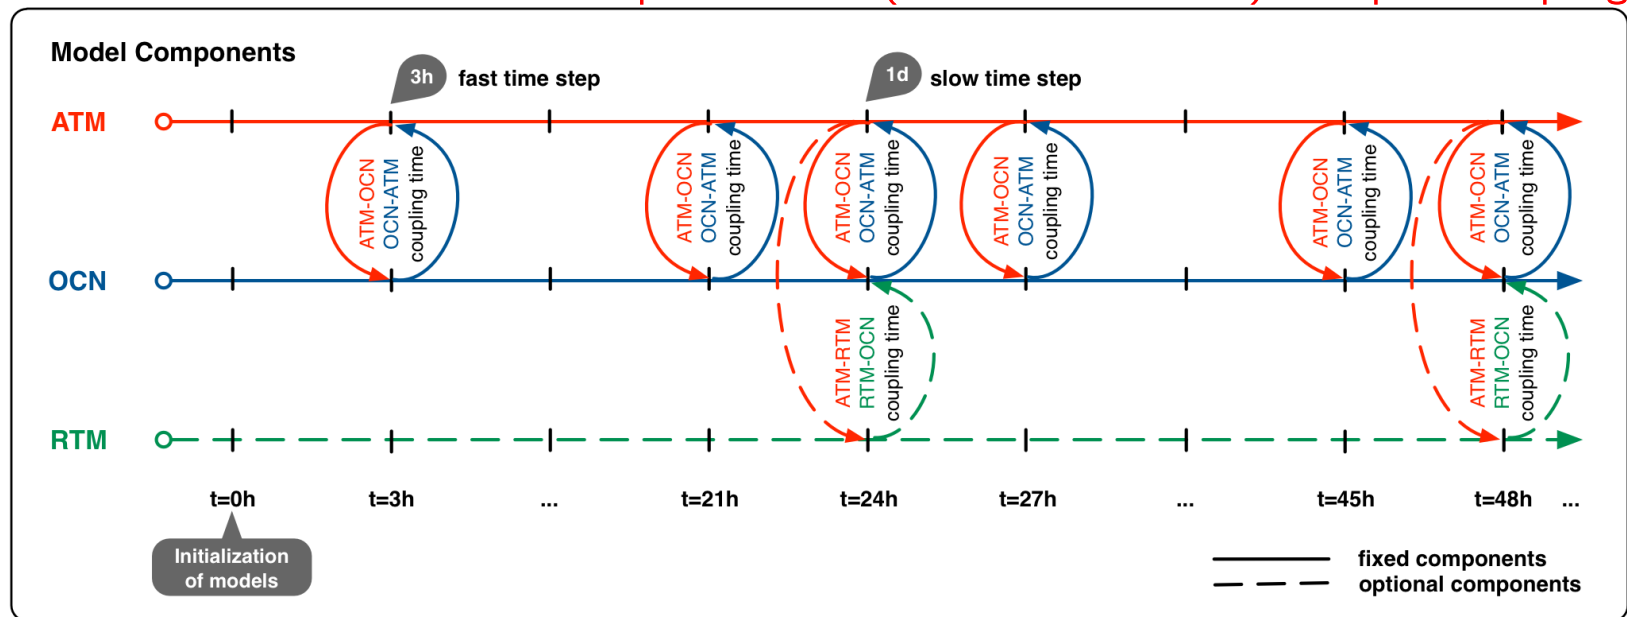

i.e. three component case (ATM+OCN+RTM)

Run Sequence in RegESM

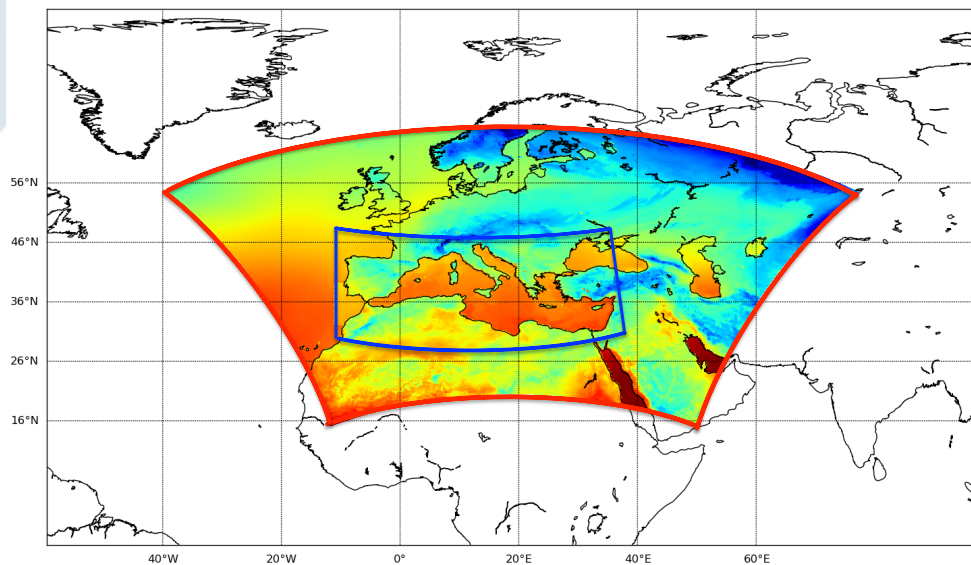

- The RegESM uses explicit coupling schemes along with the support of fast and slow time steps.
 - Fast interaction among ATM and OCN (i.e. 1 or 3 hours)
 - Slow interaction between ATM and RTM, RTM-OCN (i.e. 1 day)

i.e. three component case (ATM+OCN+RTM) + explicit coupling

Tests with RegESM

Mediterranean

South Asia

Central America

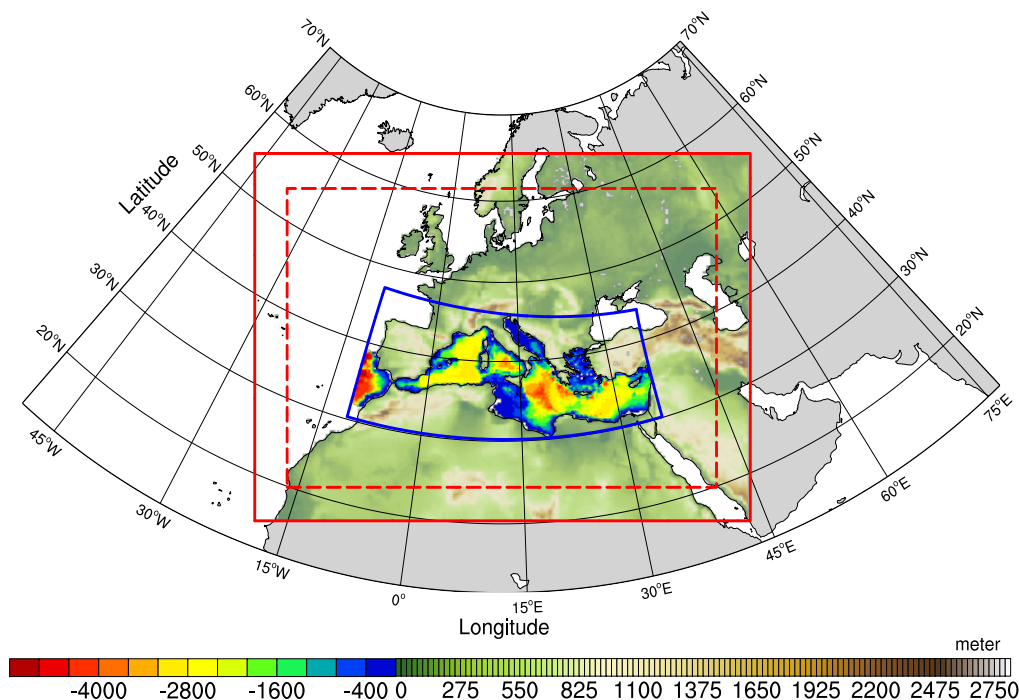

Figure 1. The domain map for the RegESM simulation with topography of atmosphere model (RegCM4) and bathymetry of ocean component (MITgcm). The solid red box indicates full atmospheric model domain, relaxation zone is indicated between solid and dashed red box. The blue solid box shows ocean model domain.

RegCM4 configuration:

MED-CORDEX experiment from 1979 up to 2013.

Model version: RegCM4.5

Horizontal Resolution: 20 km

Boundary conditions: ERA-Interim Reanalysis 0.75°

In our experiments we use the convection scheme of Grell over land and MIT-Emanuel scheme over ocean. The land-atmosphere interactions are parameterized using the biosphere-atmosphere transfer scheme (BATS) and the Zeng scheme is used to represent fluxes from water surfaces.

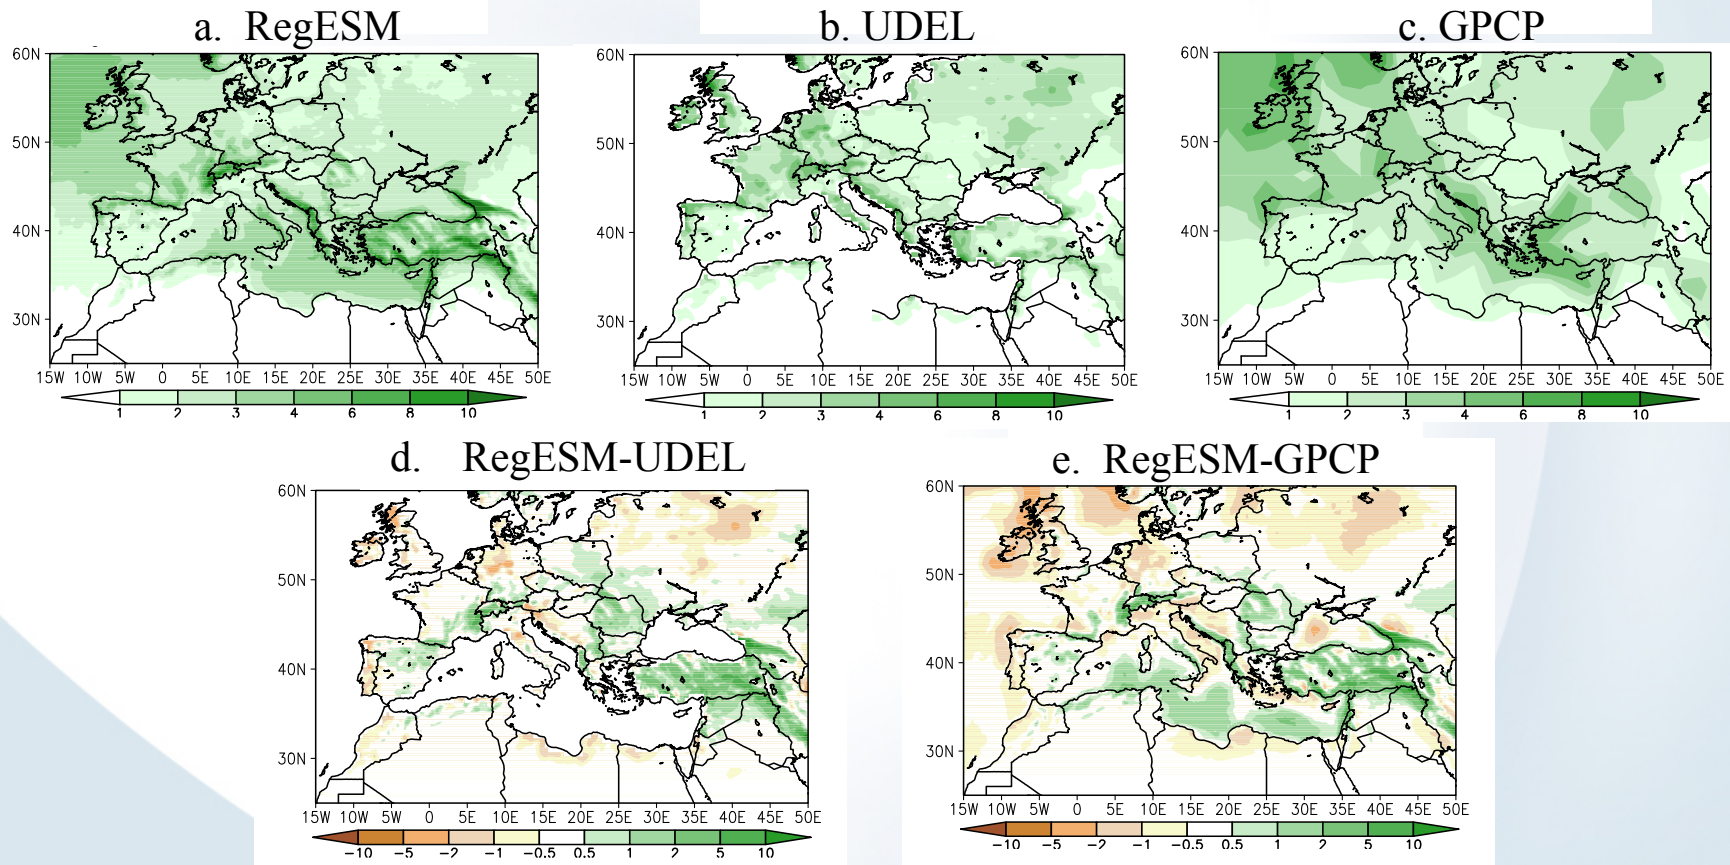

MITgcm configuration:

1/12° horizontal resolution, 75 vertical levels.

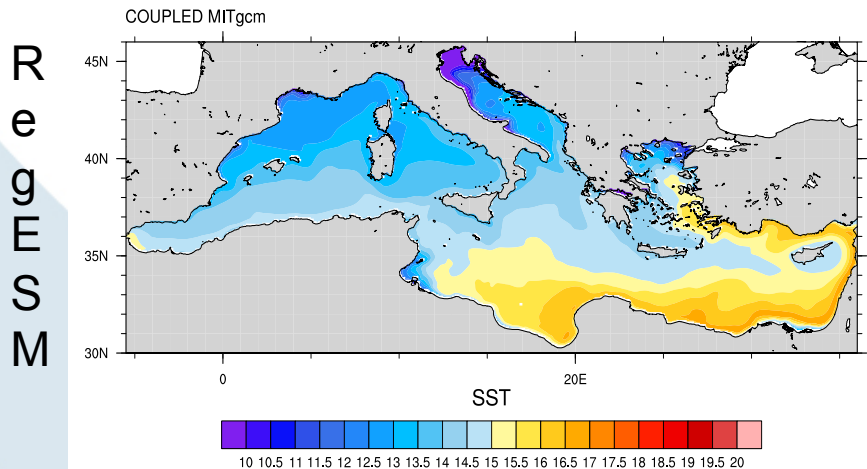

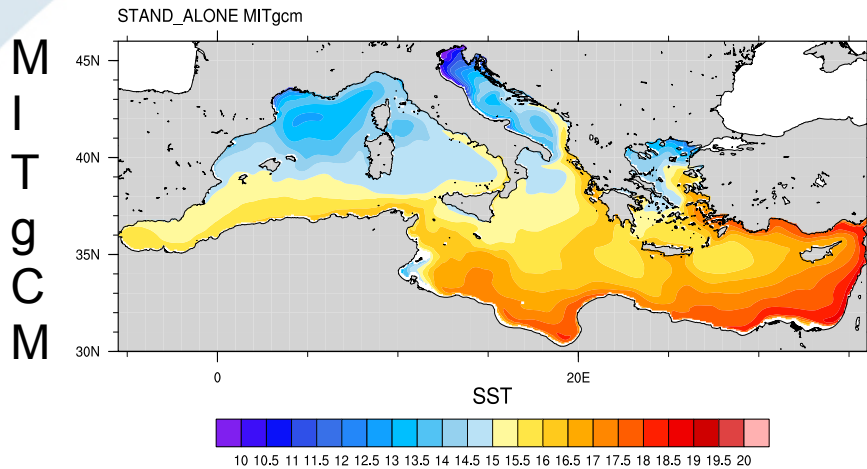

Sea Surface Salinity with time relaxation constants of 2 days and 1.8 days respectively.

The benchmark simulation is a stand-alone run forced by the air-sea fluxes from ALADIN dynamical downscaling of ERA-interim (12 km horizontal resolution), and with relaxation terms on Sea Surface Temperature
