

# Weak Lensing with The Dark Energy Survey Status & Plans

Joe Zuntz

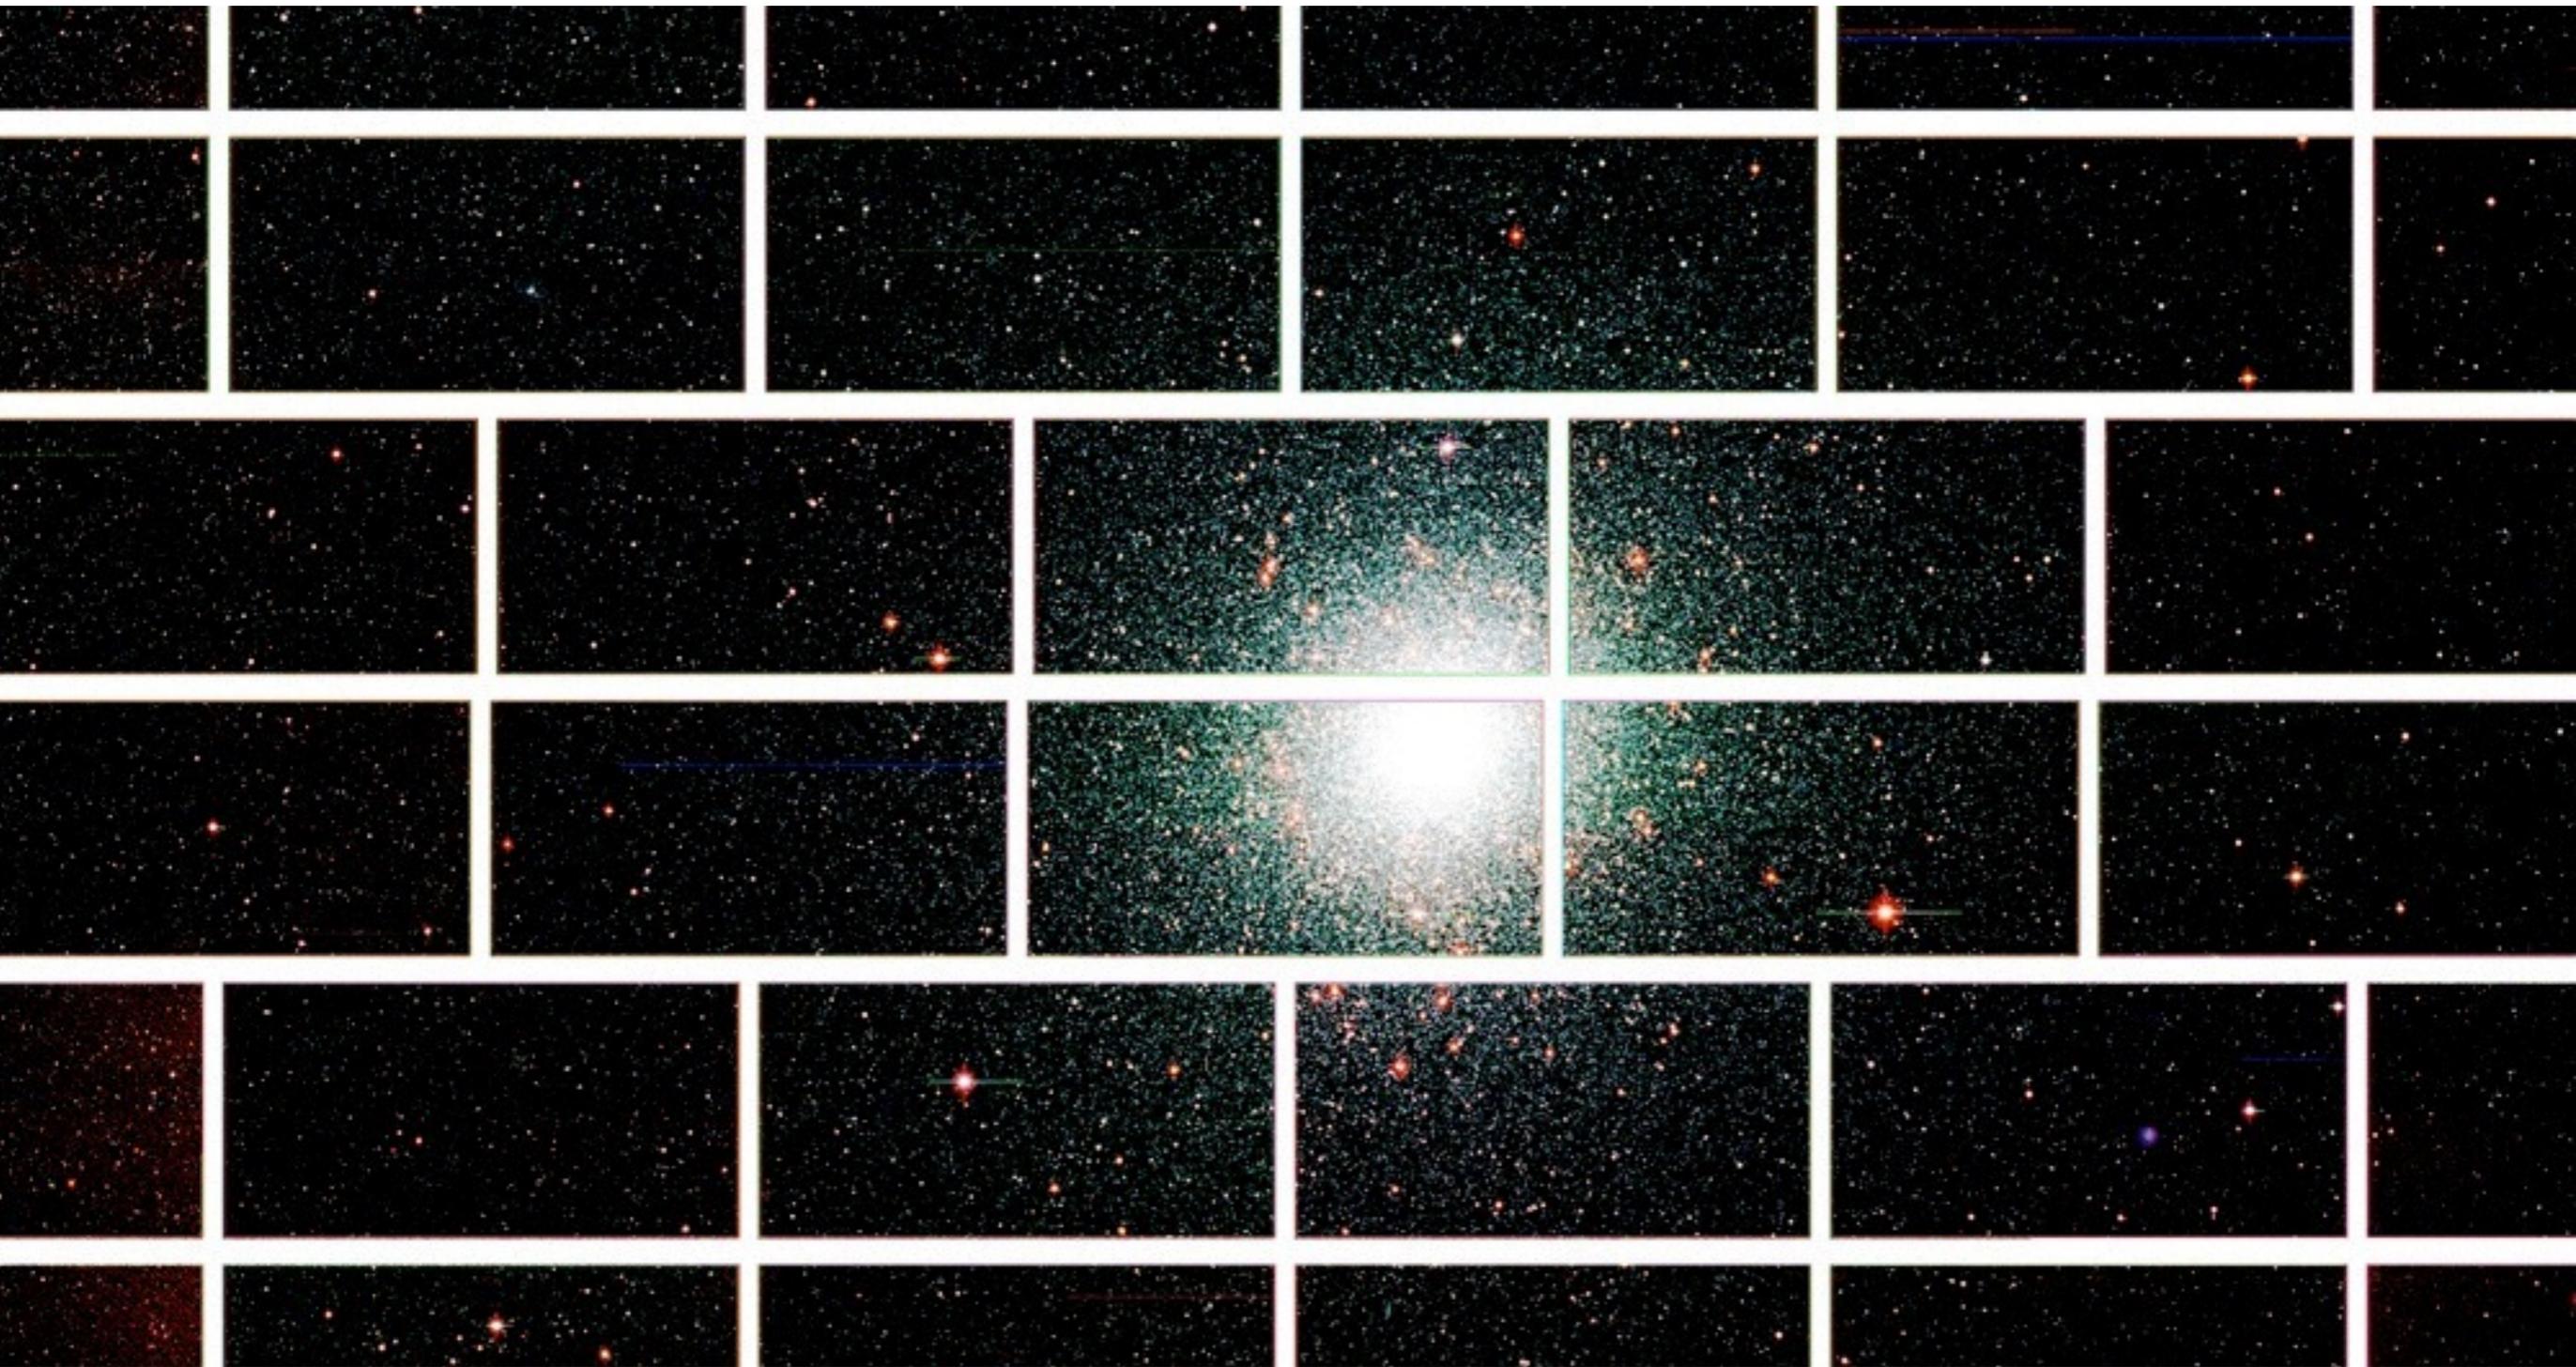

# Dark Energy Survey

- DECam on Blanco ->
- 5000 sq degrees
- g, r, i, z, y
- 5 year mission  
525 nights
- 300 million galaxies
- $0.2 < z < 1.3$

# Dark Energy Survey

# Survey Area

CFHT  
150 sq  
deg

DES SV  
~150 sq  
deg

**DES**  
**5000**  
**sq. deg.**

# DES Killer Application

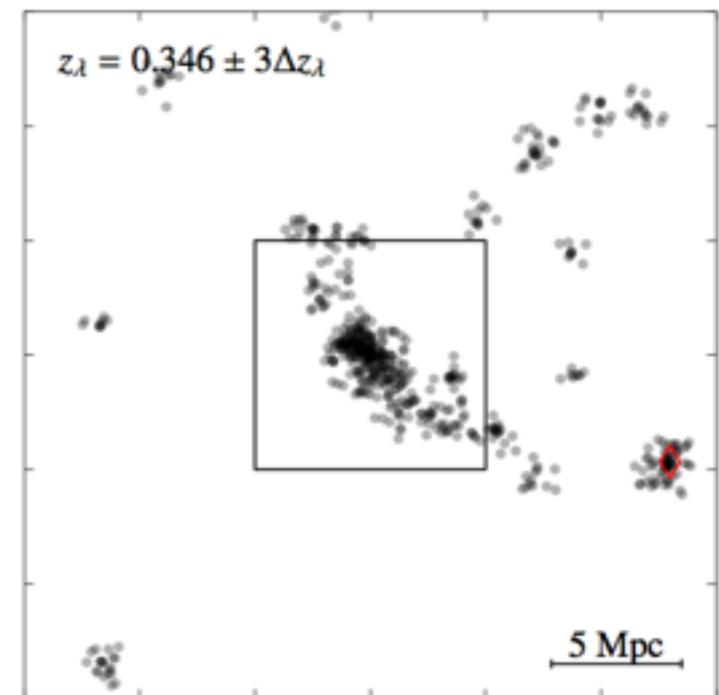

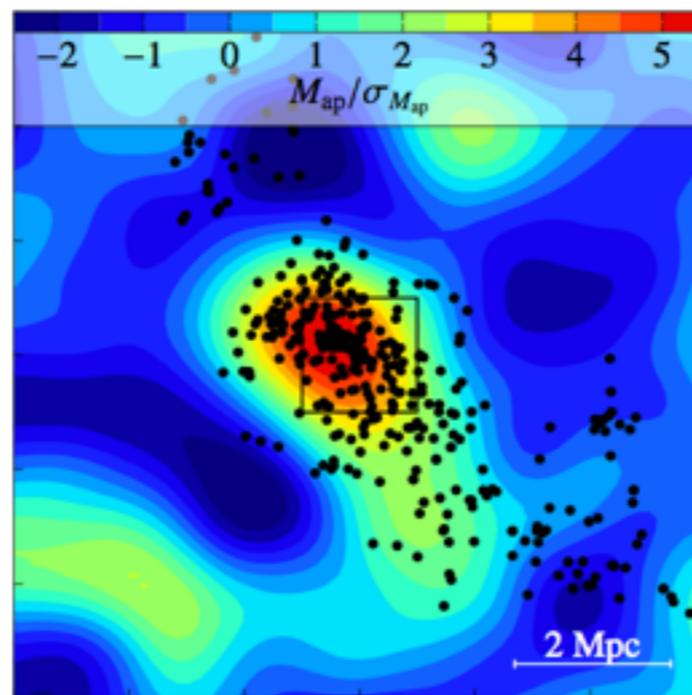

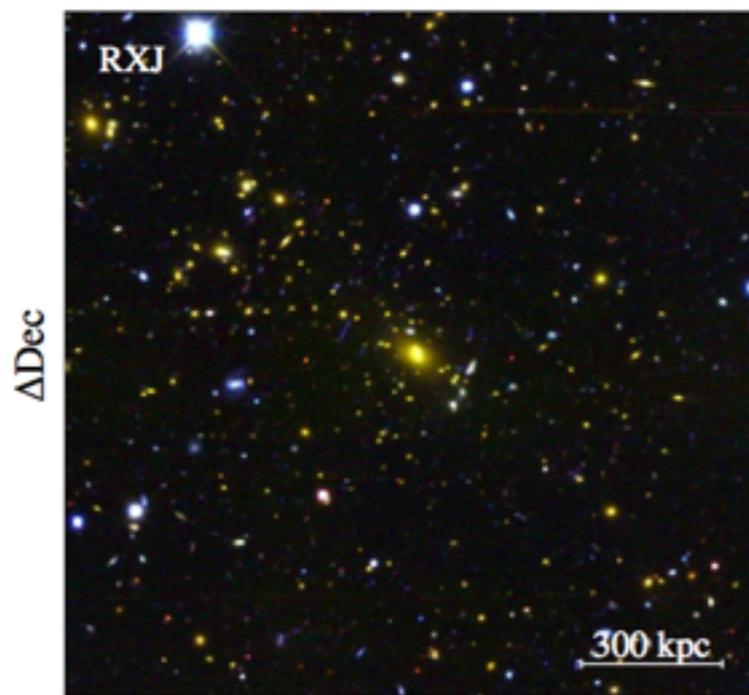

- Wide area survey
- Precision PSF
- Good depth
- No time wasted on spectroscopy 😊

# Early Science: Cluster Masses

Melchior et al arxiv 1405.4285

# Cluster Masses

- Measure mass of four massive clusters  
90 second exposures in g,r,i,z and 50 sec y
- Photo-z from Oyaizu et al 2008 (SDSS pipeline)
- im3shape galaxy shape measurements (Zuntz et al 2013)

# Cluster Masses

- Sample NFW parameters with emcee (fix cosmology  $h=0.7$ ,  $\Omega_m=0.3$ )
- Predict projected surface density hence mean shear

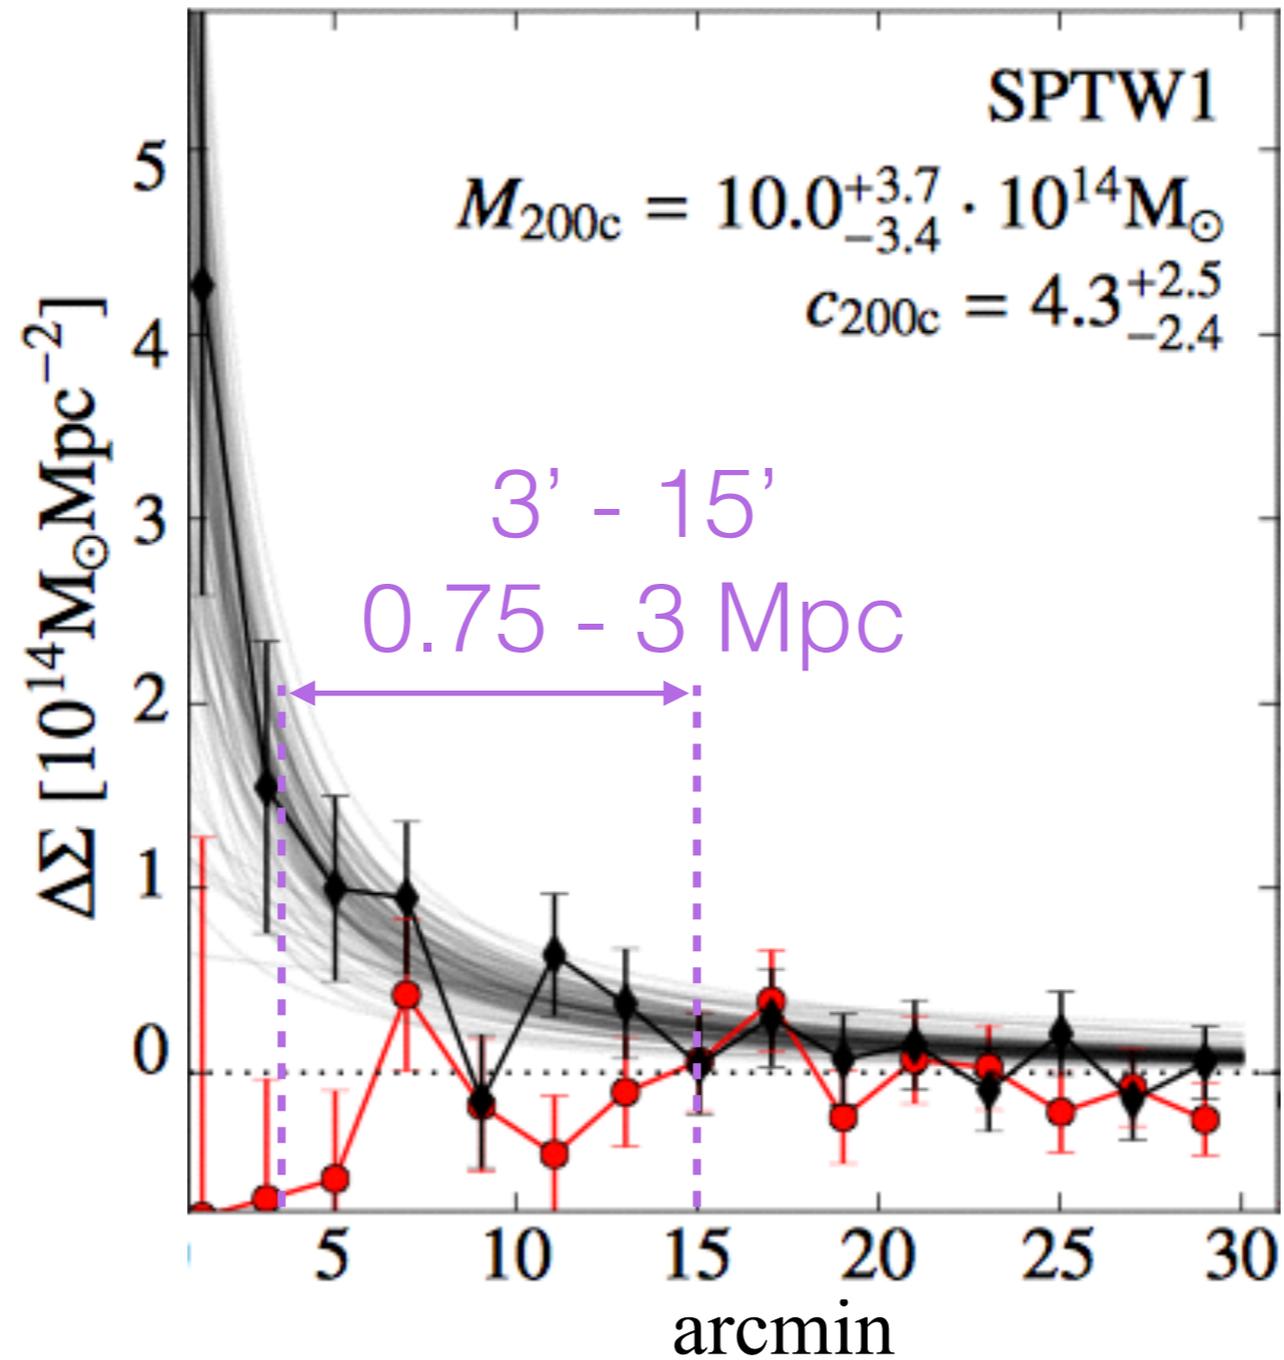

$$\rho(r) = \frac{\rho_0}{(r/r_s)(1 + r/r_s)^2}$$

$$\Sigma(R) = \int_{-\infty}^{\infty} \rho(r = \sqrt{\chi^2 + R^2}) d\chi$$

$$\gamma_t(r) = \frac{\bar{\Sigma}(< r) - \Sigma(r)}{\Sigma_c}$$

$$\ln \mathcal{L} = -\frac{1}{2} \sum_j \frac{[\Delta \hat{\Sigma}(r_k) - \Sigma_{\text{crit}}(j) \epsilon_t(j)]^2}{\Sigma_{\text{crit}}^2(j) [\sigma_j^2 + \sigma_\epsilon^2]}$$

# Cluster Masses

# Cluster Masses

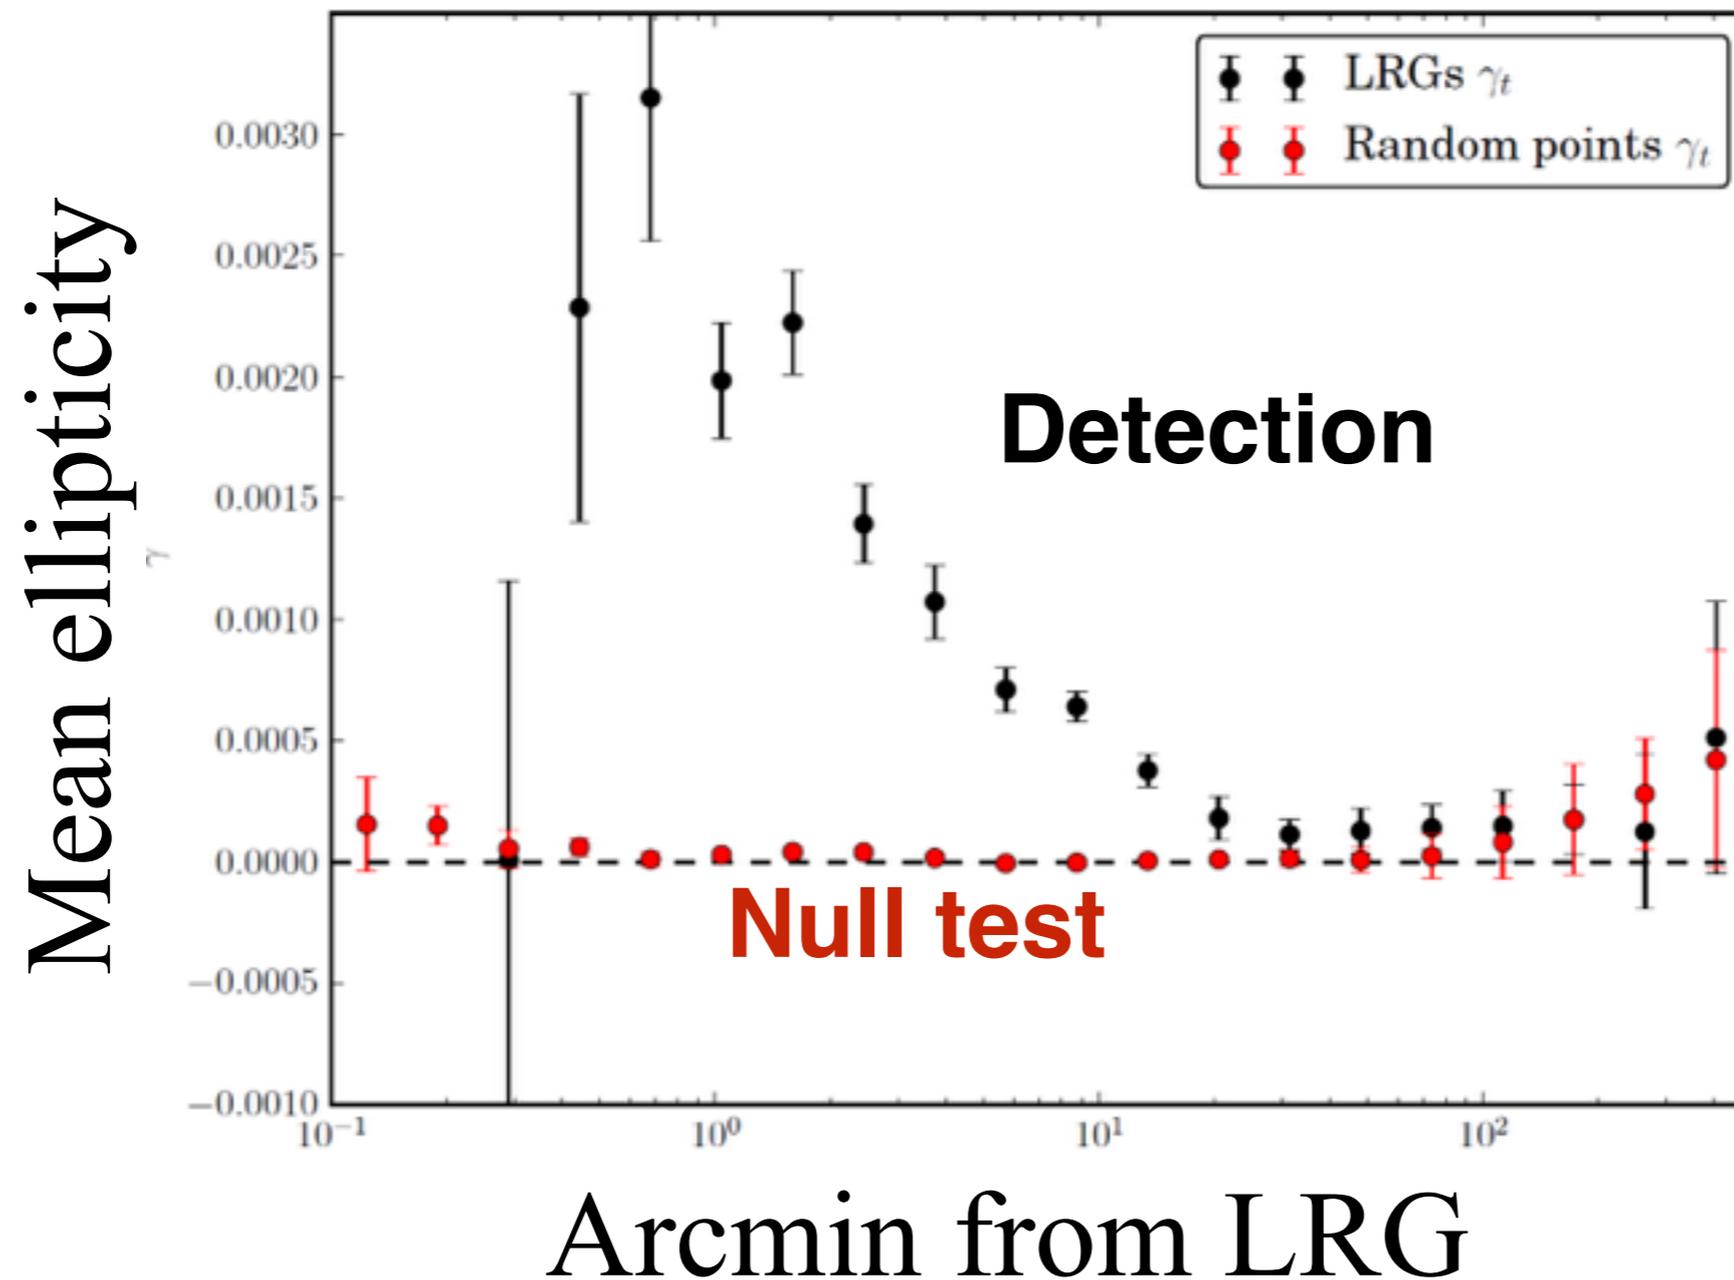

Cluster name	$M_{200c}$
RXC J2248.7-4431	$17.6^{+4.5}_{-4.0}$
1E 0657-56	$14.2^{+10.0}_{-6.1}$
SCSO J233227-535827	$10.0^{+3.7}_{-3.4}$
Abell 3261	$8.6^{+8.6}_{-3.9}$

# Early Science: Galaxy-Galaxy Lensing

# Galaxy-Galaxy Lensing

- Correlate lensing and galaxy positions
- Do galaxies point at other galaxies?
- Expect LRGs in large halos

# Galaxy-Galaxy Lensing

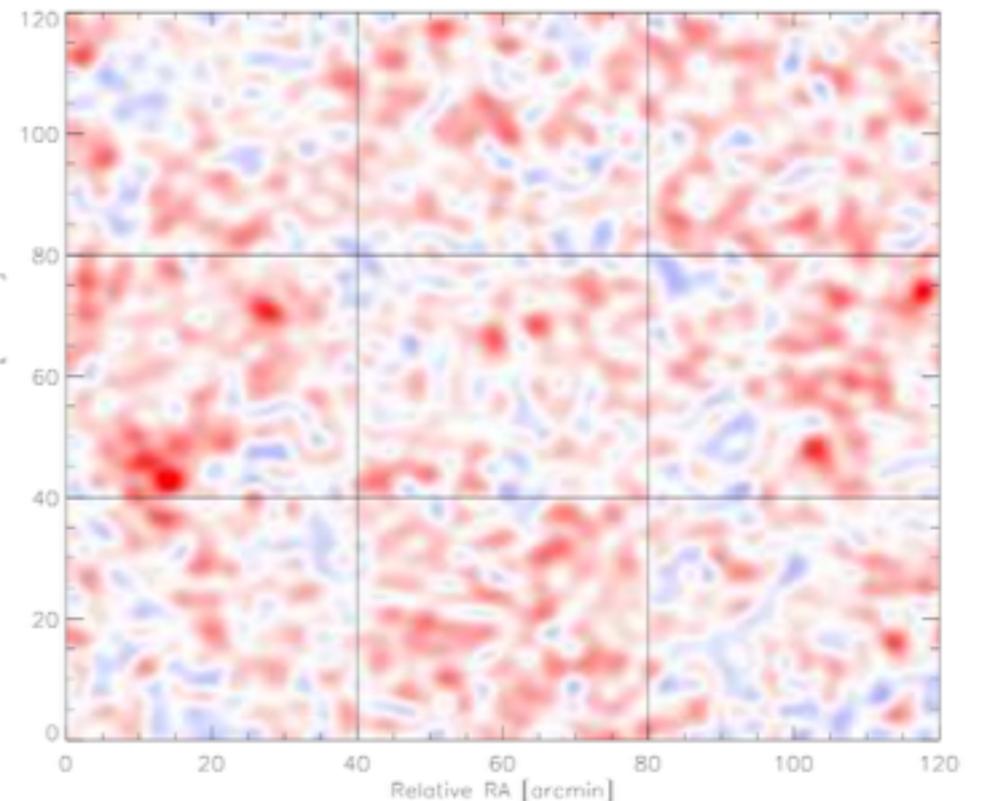

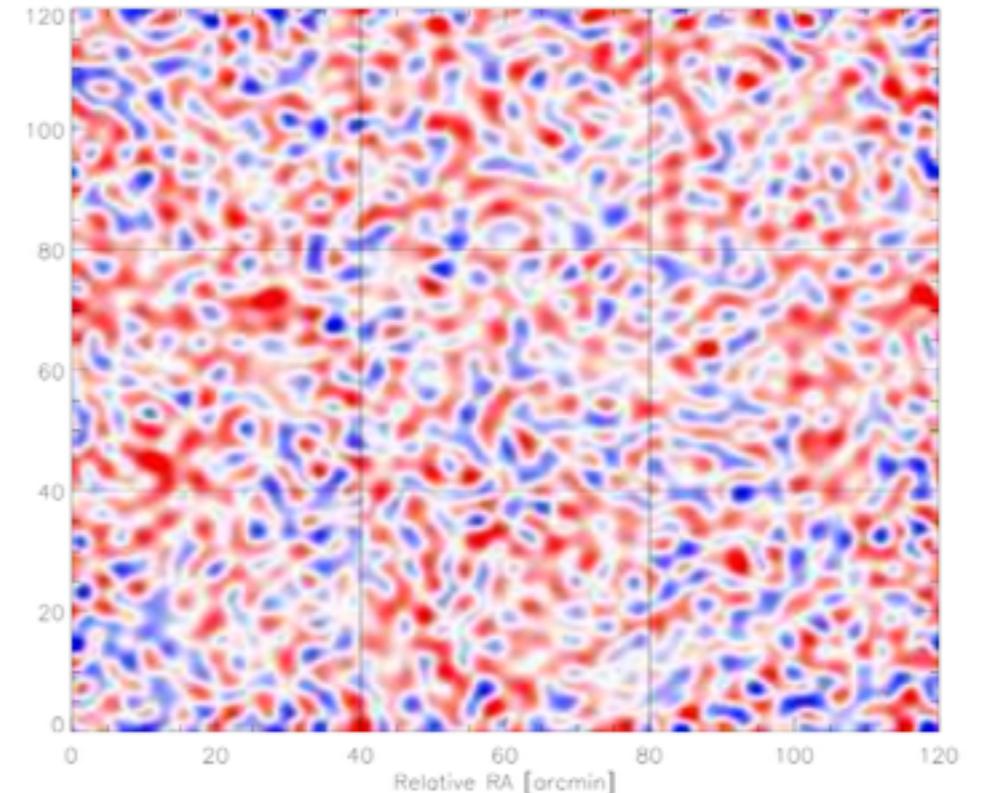

Carles Sánchez

with Joseph Clampitt, Bhuv Jain, Niall MacCrann, Vinu Vikram, and many others

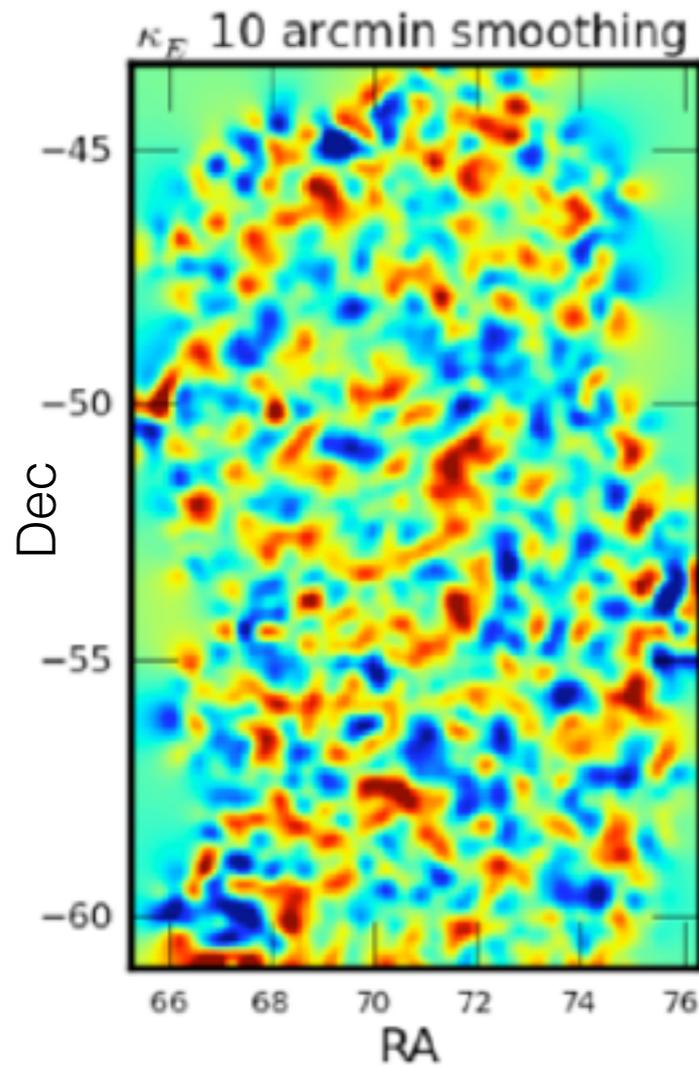

# Early Science: Mass Mapping

# Mass Mapping

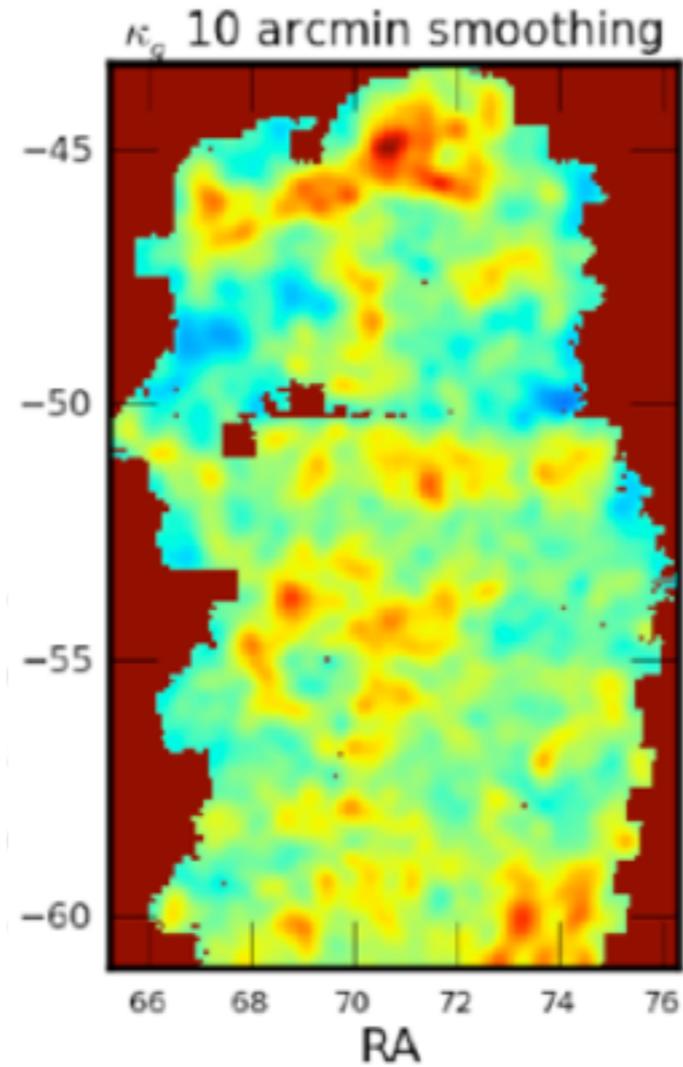

- Invert lensing map => projected mass field
- Simple: 
$$\tilde{\Sigma}(\mathbf{k}) = k^{-2} \begin{pmatrix} k_1^2 - k_2^2 \\ 2k_1k_2 \end{pmatrix} \cdot \begin{pmatrix} \tilde{e}_1 \\ \tilde{e}_2 \end{pmatrix}$$
- Advanced (Szepietowski et al):
  - Phase prior from number density

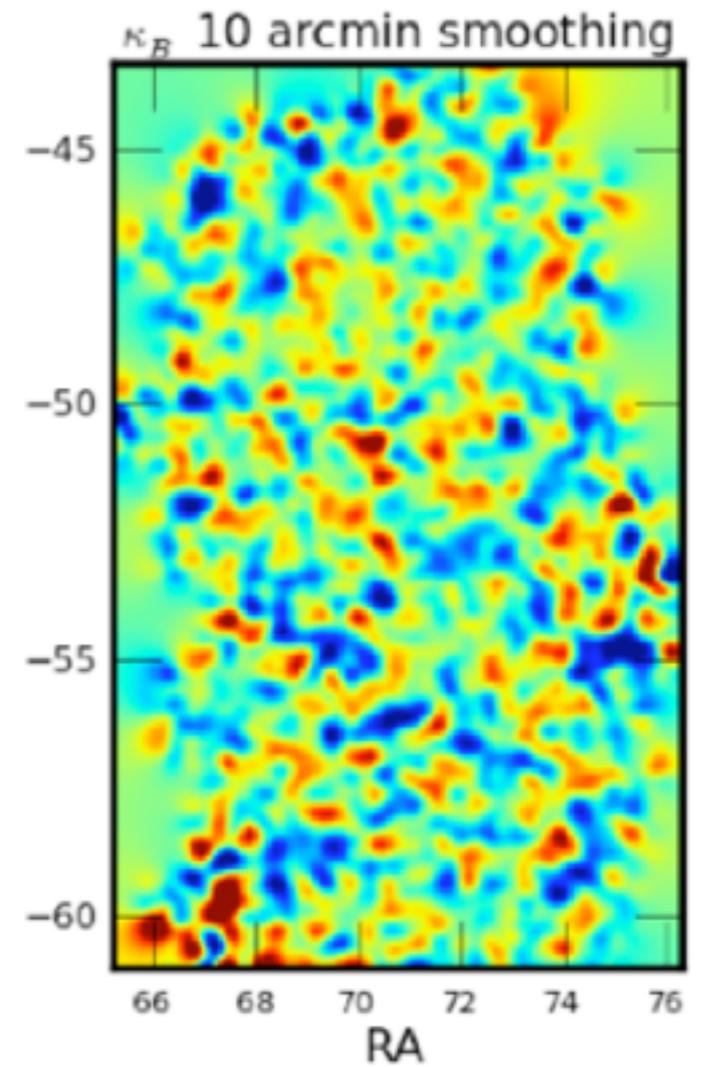

# Mass Mapping

Projected  
density

Galaxy  
Count

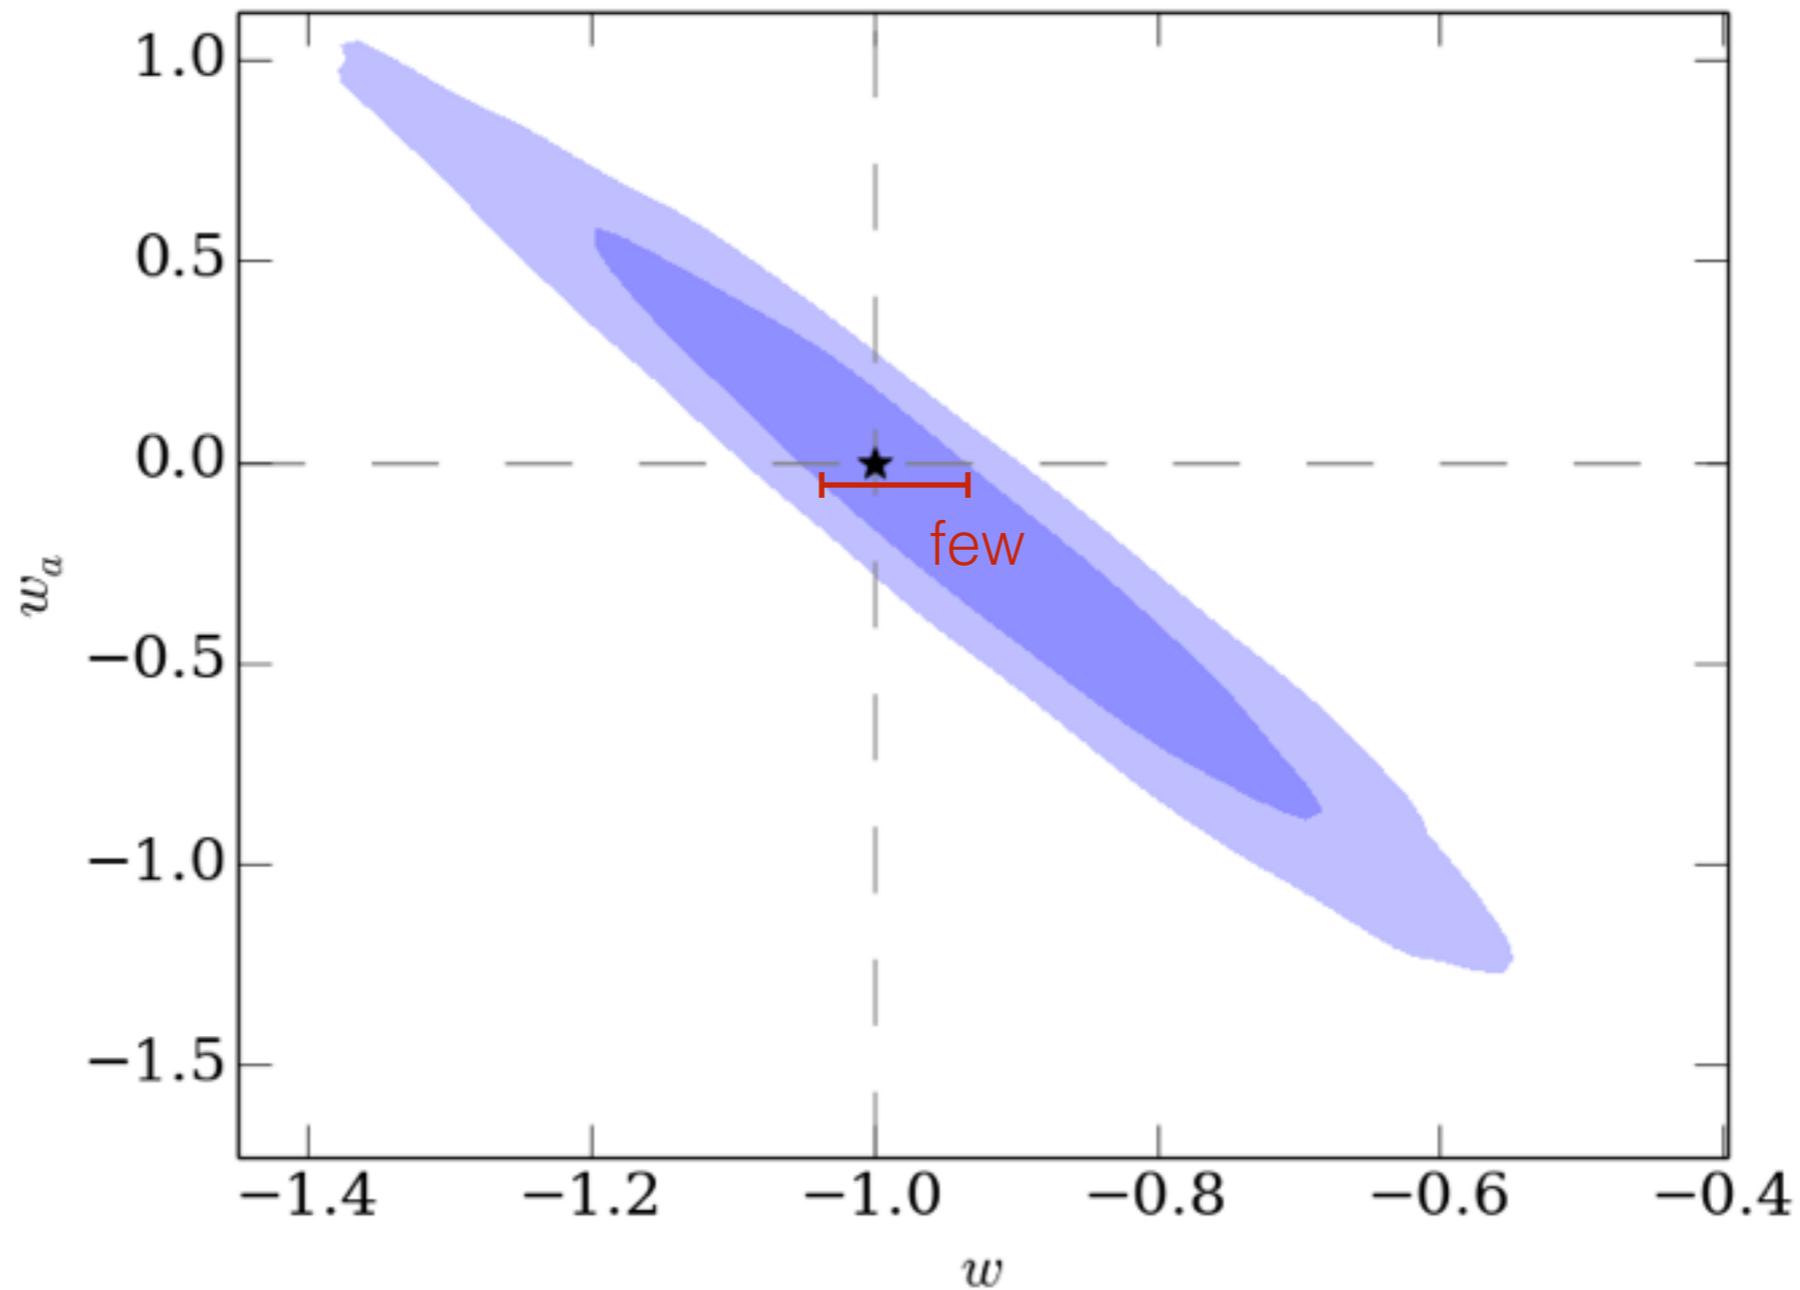

Null  
Test

# DES Lensing Future

# Five Year Mission

- Dark Energy Equation of State  $w(z)$   
~ few % accuracy
- Combined probes
  - Covariances hard!

# Five Year Mission

Made with CosmoSIS! <http://bitbucket.org/joezuntz/cosmosis>

# Weak Lensing

## Systematic Errors/Physics

**Baryons & Dark Matter  
Structure**

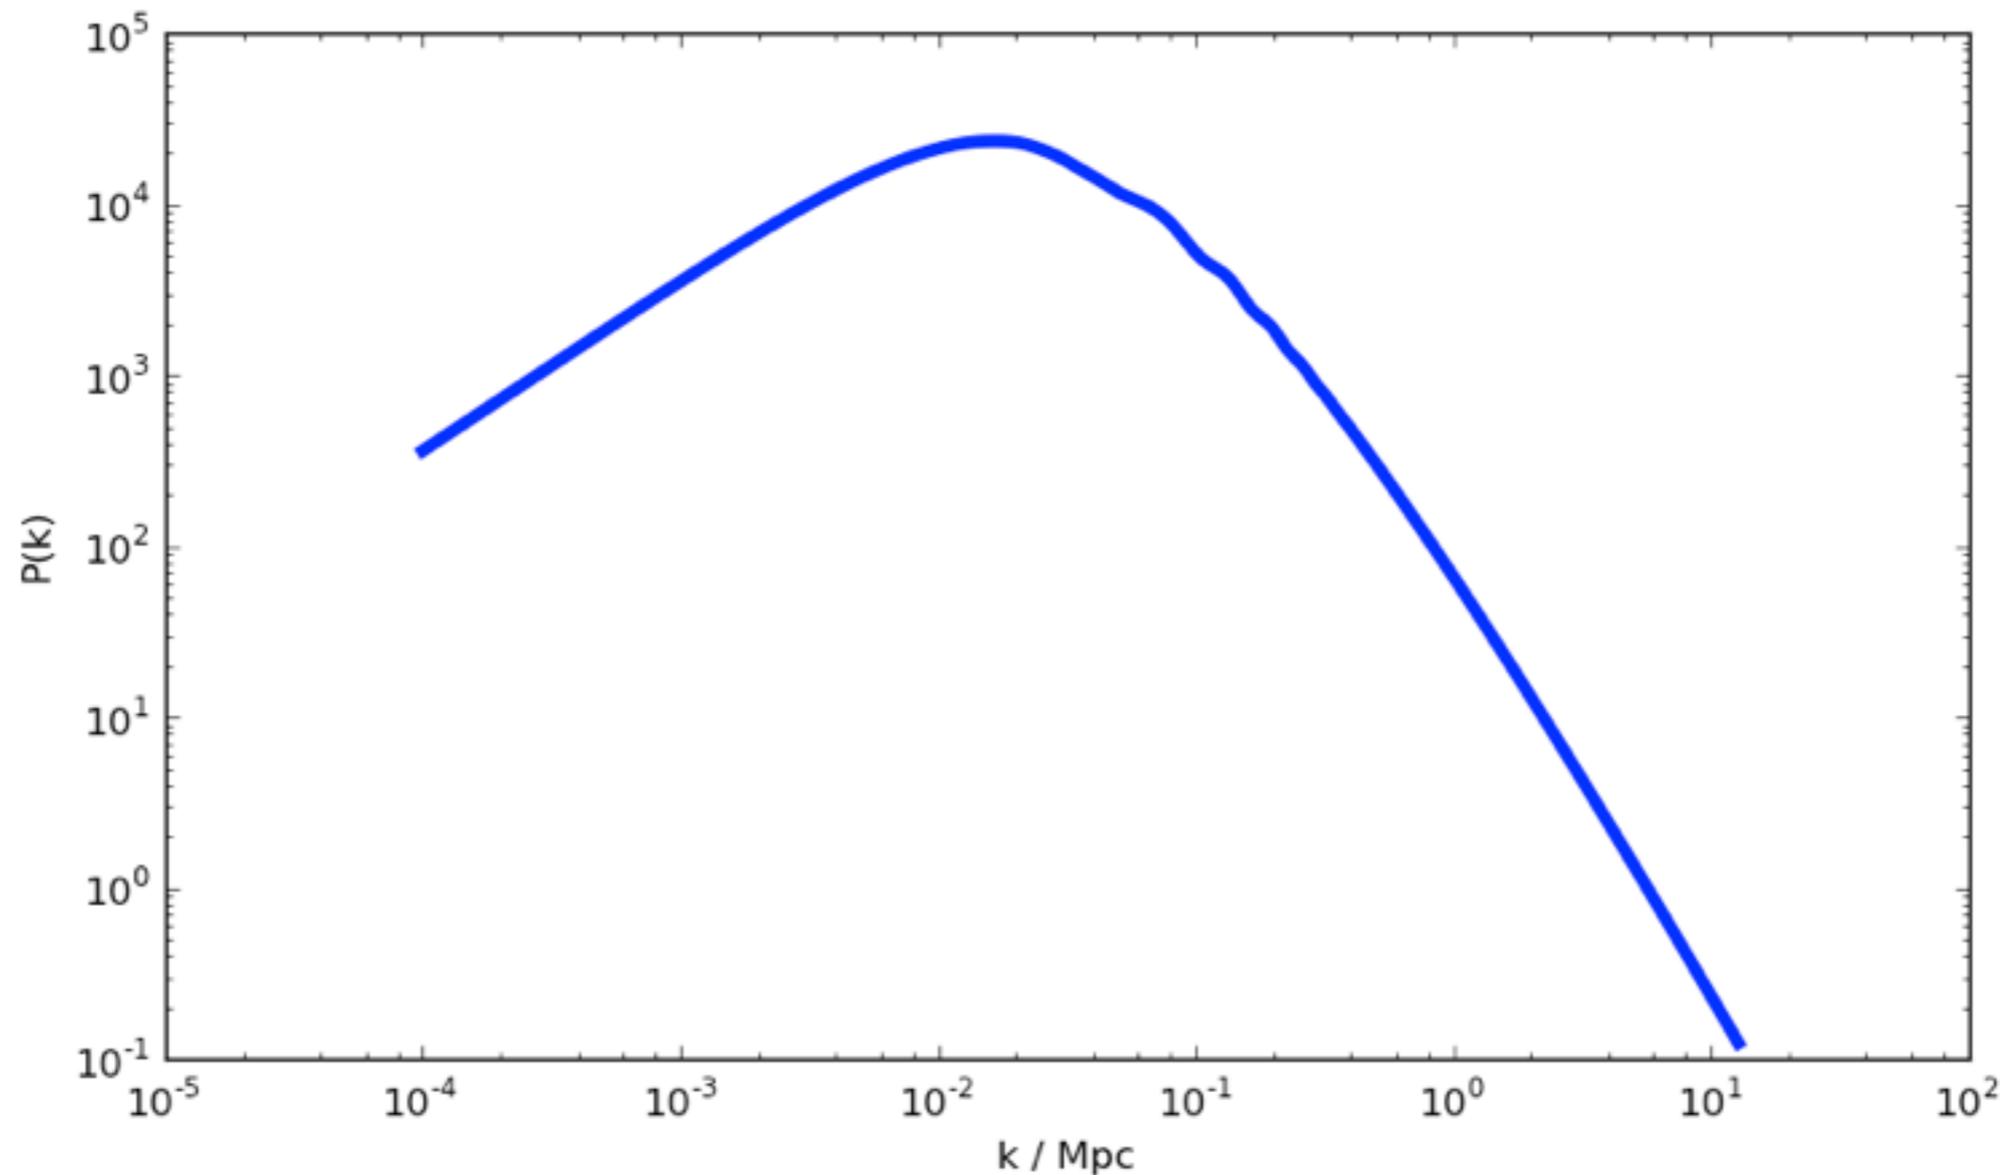

**Intrinsic Galaxy  
Alignments**

**Photometric redshifts**

**Galaxy shape  
measurements**

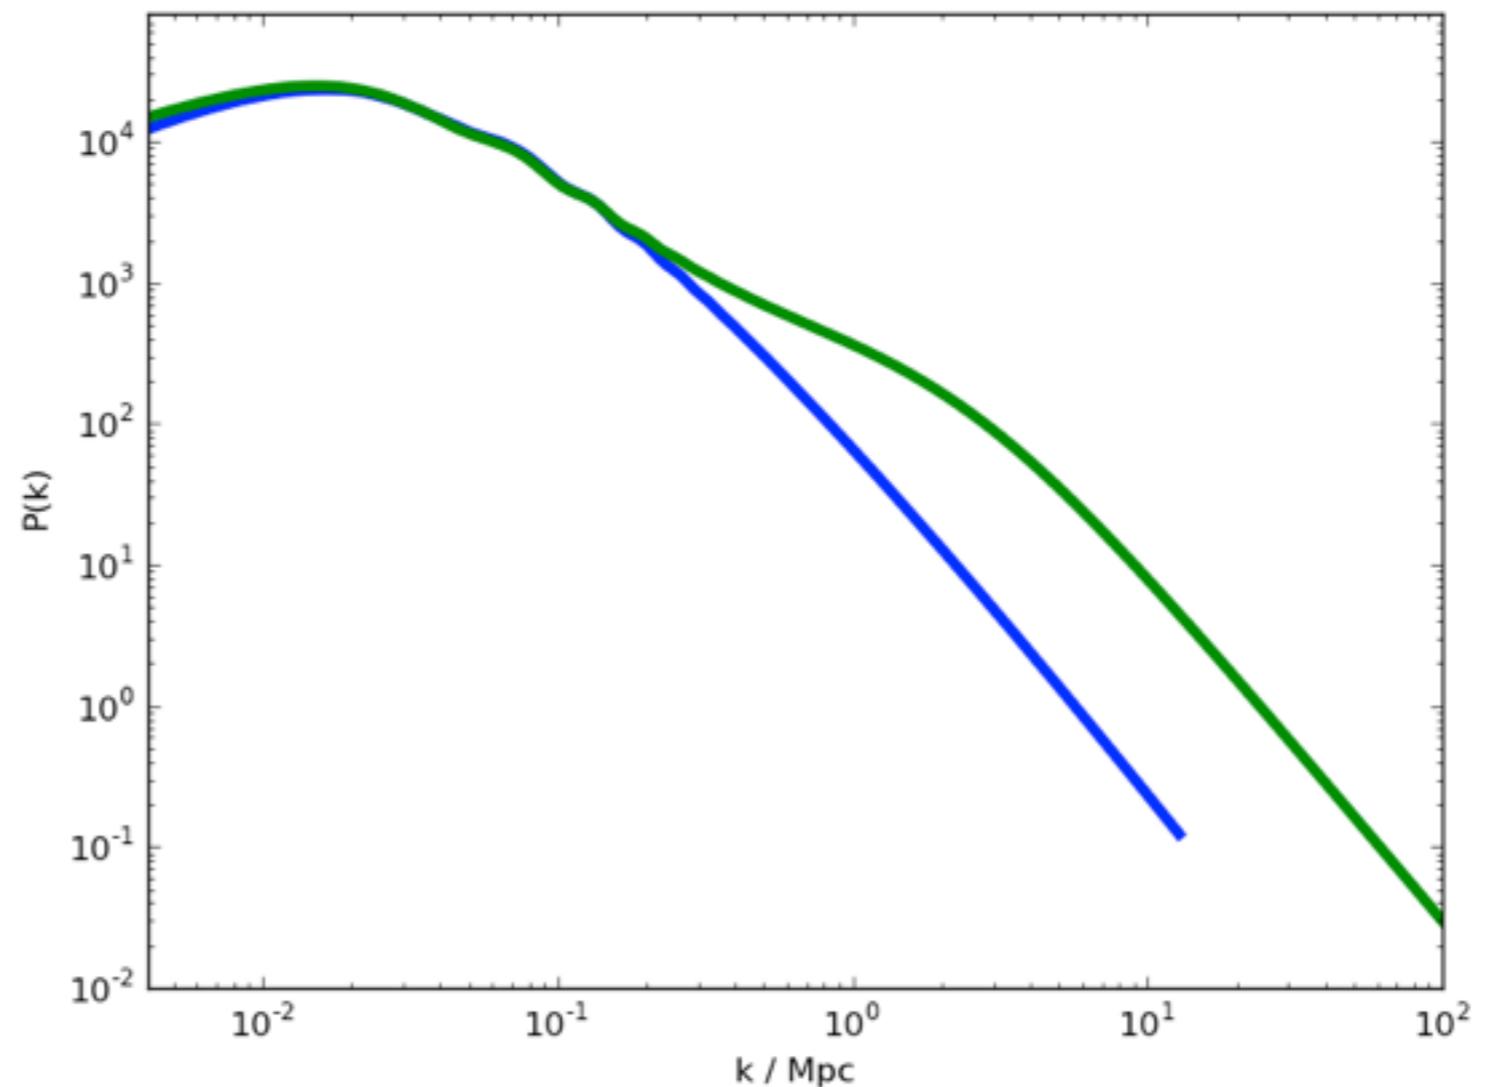

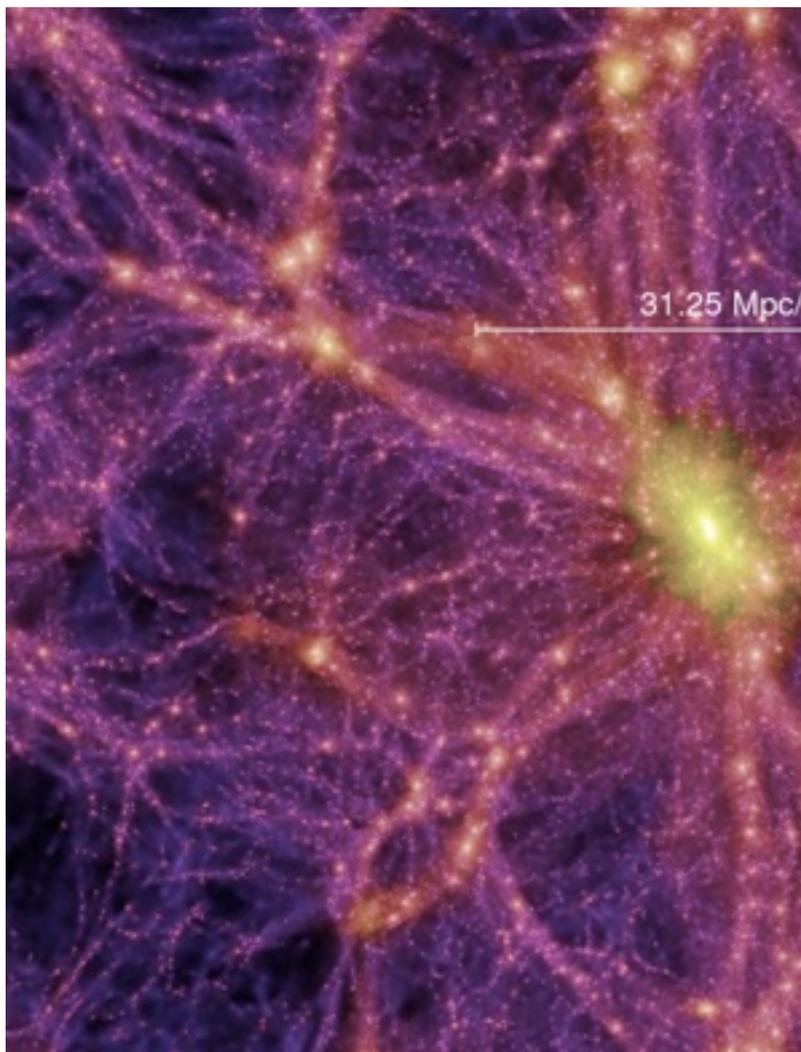

# Baryons & Dark Matter

- Predicting dark matter power spectra  
**EASY: Linear DM-only structure**

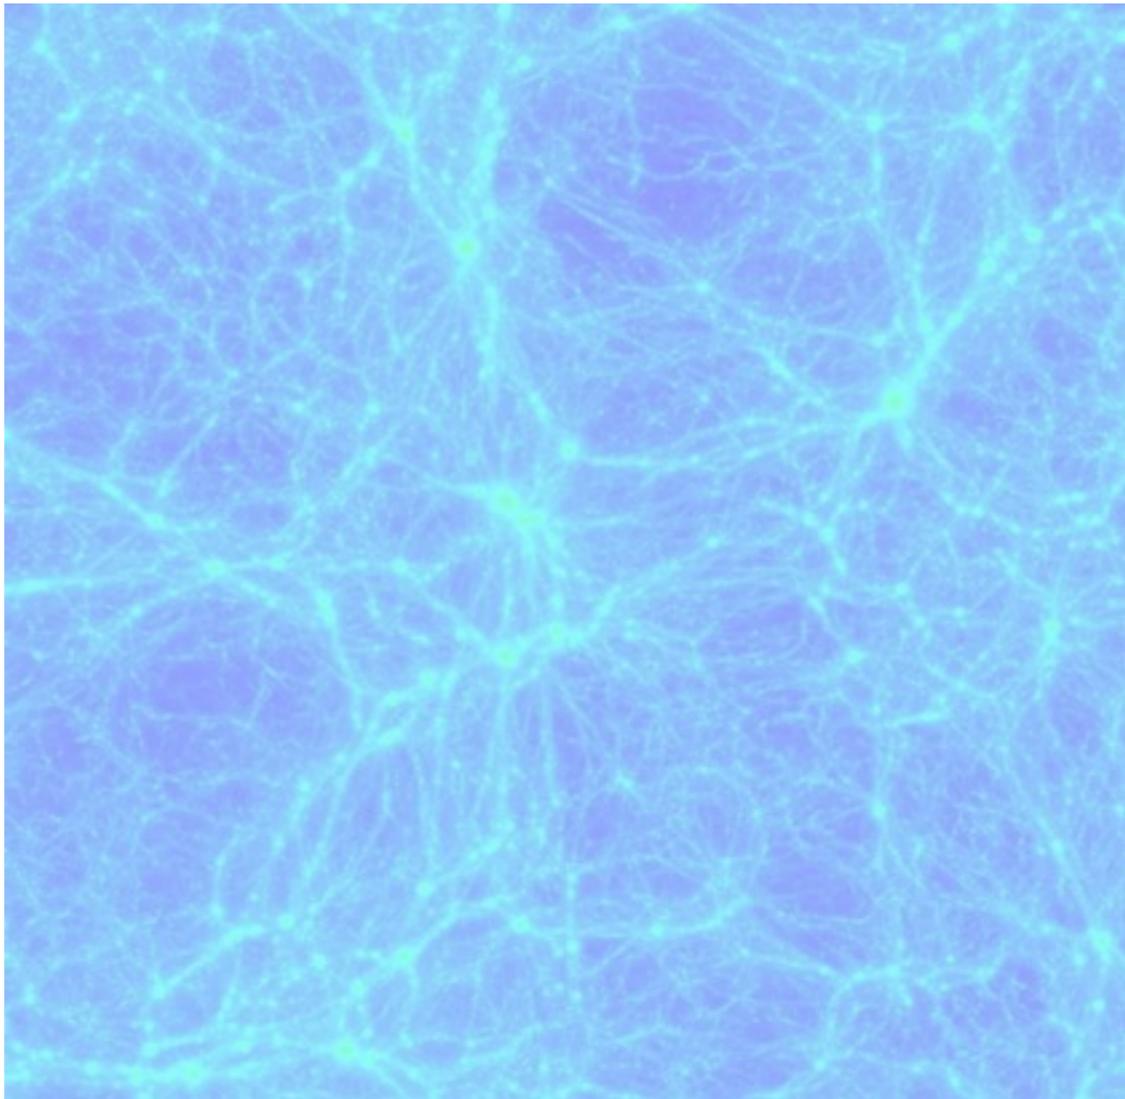

# Baryons & Dark Matter

- Predicting dark matter power spectra  
**HARD: Non-Linear DM-only structure**

# Baryons & Dark Matter

- Predicting dark matter power spectra  
**VERY HARD: Structure with Baryons**

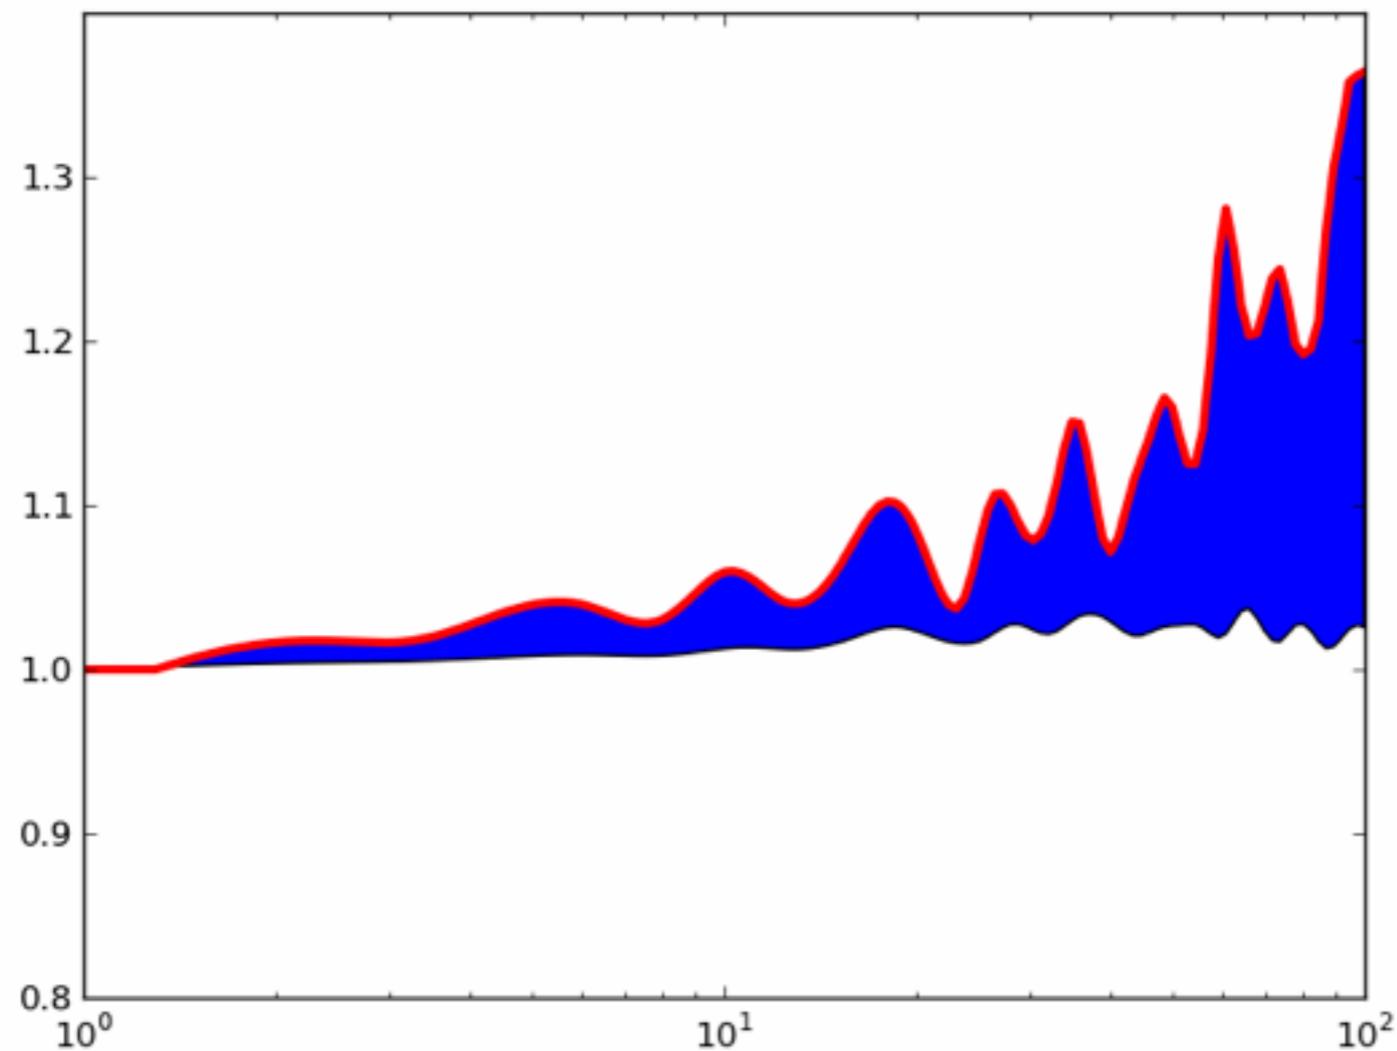

- Supernova feedback
- Star formation law
- Gas equation of state
- AGN numbers & feedback
- Reionization
- Cooling function

OverWhelmingly Large Simulation OWLS

# Baryons & Dark Matter

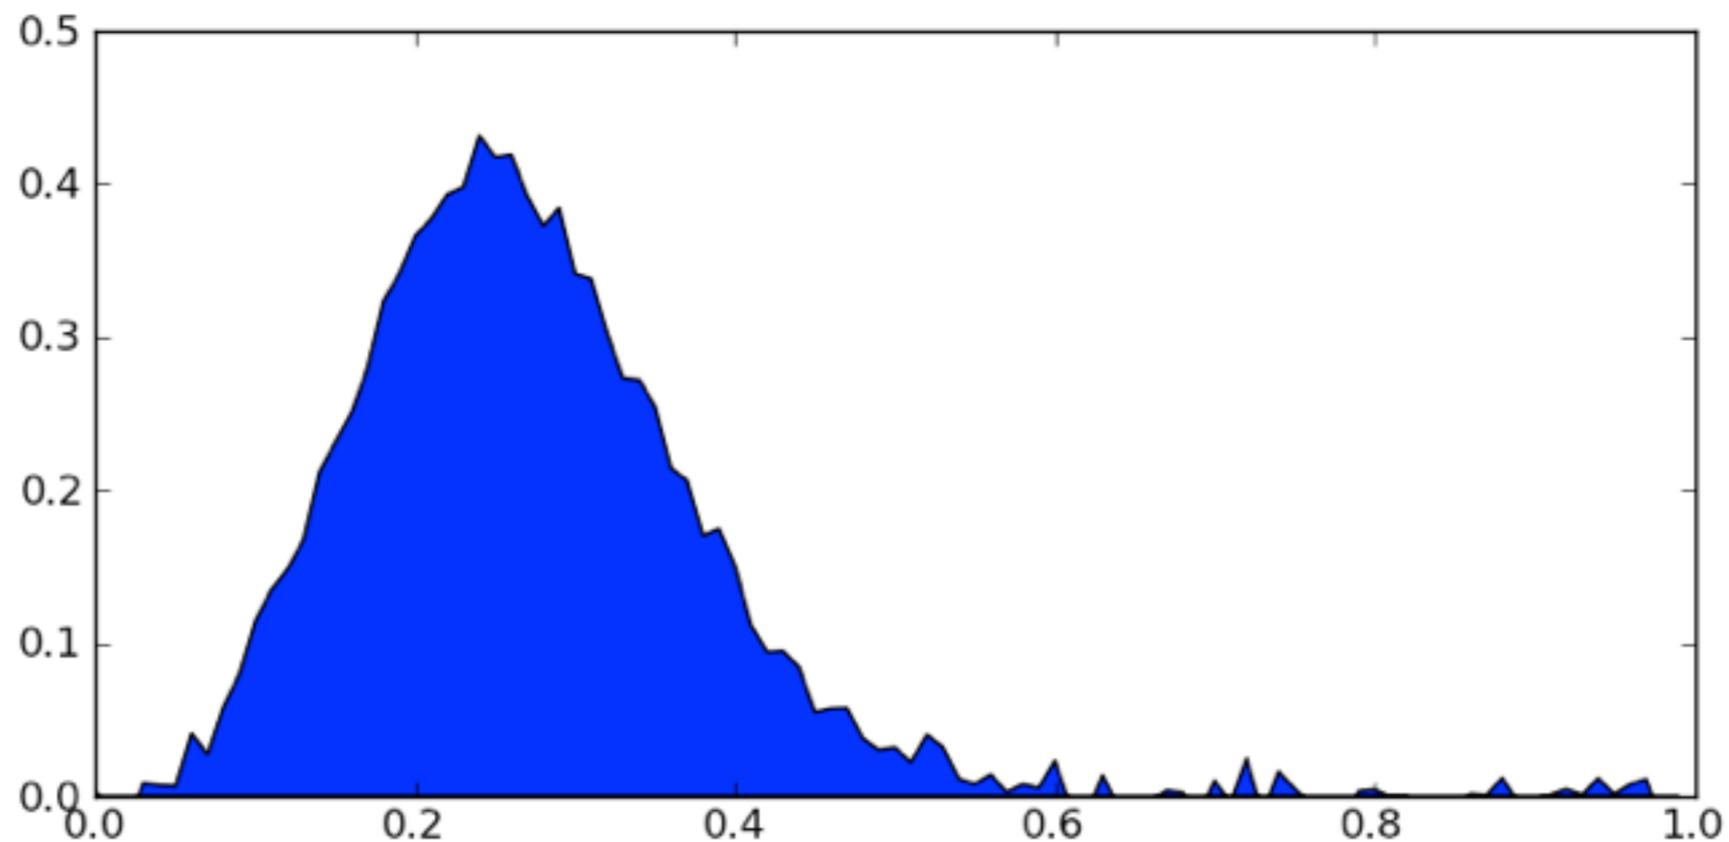

- Predicting dark matter power spectra  
**VERY HARD: Structure with Baryons**

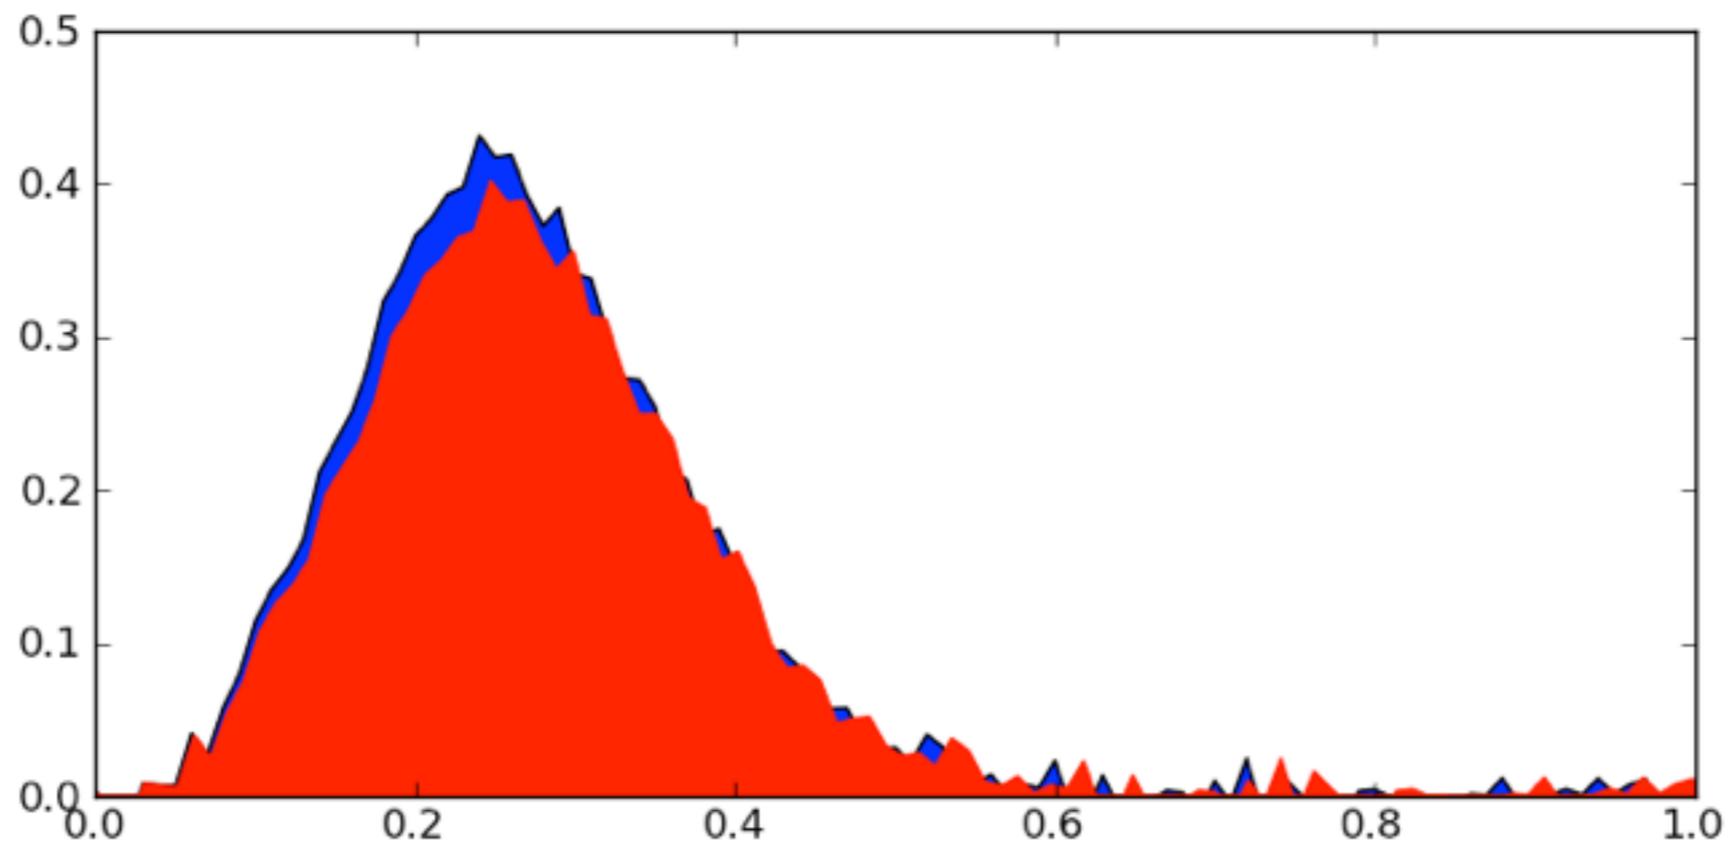

# Photo-z

- **Photo-z codes estimate  $z$** 
  - Or better still  $p(z)$
- **Get  $n(z)$  of bin of galaxies**
- **Calibrate with spectroscopy**

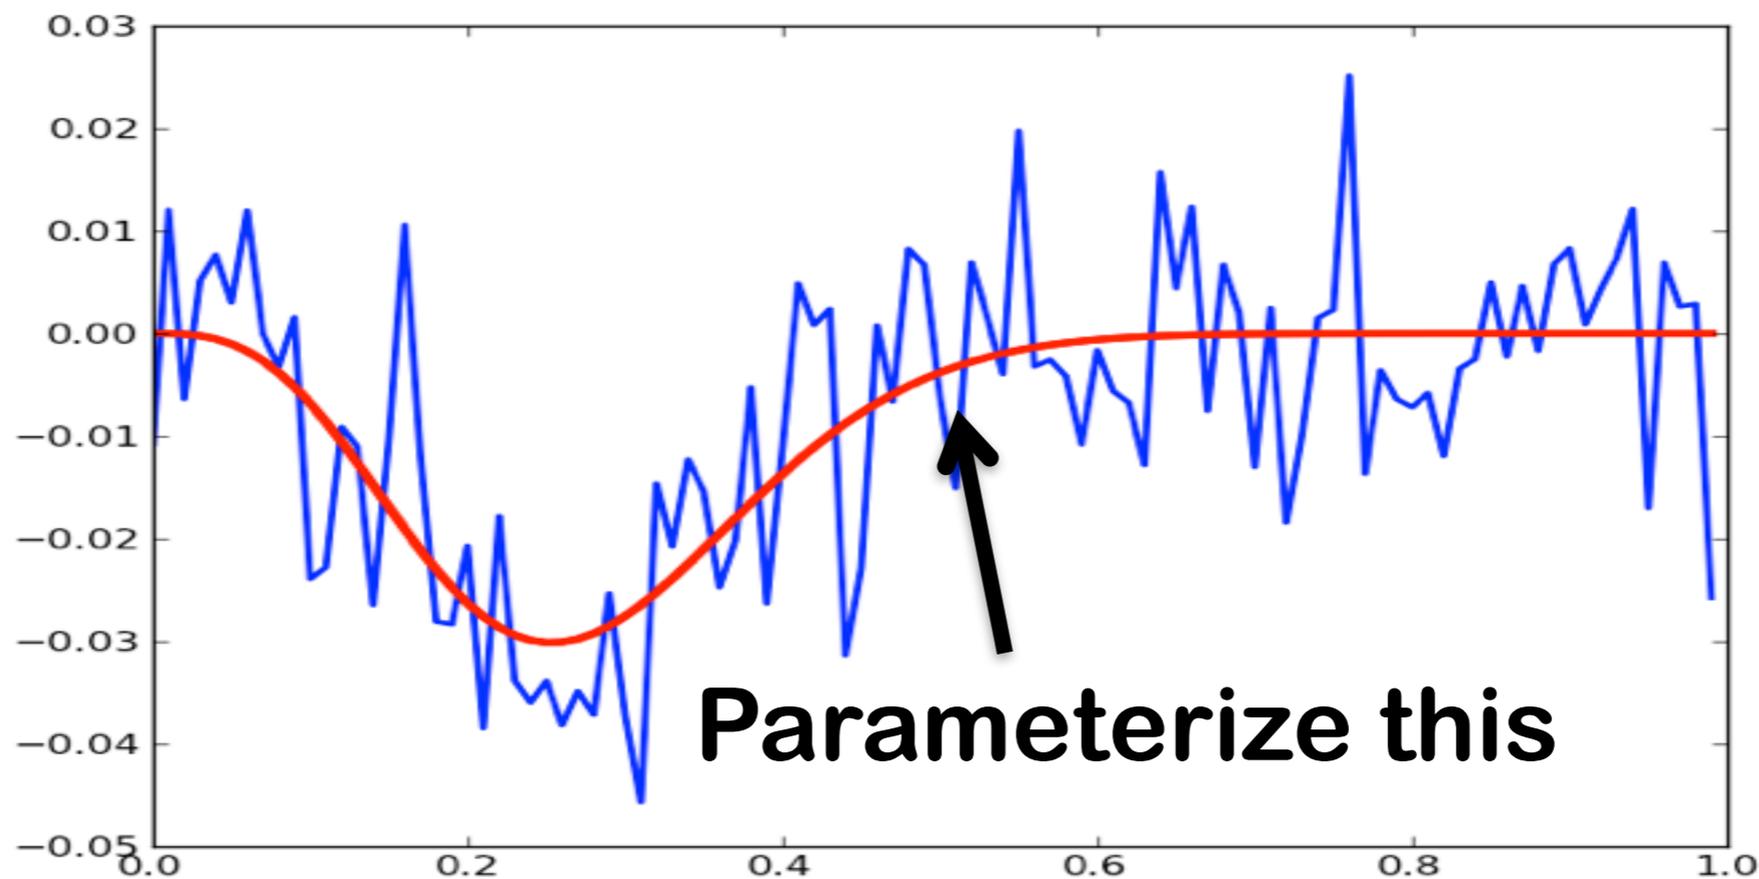

# Photo-z

- **Photo-z codes estimate  $z$** 
  - Or better still  $p(z)$
- **Get  $n(z)$  of bin of galaxies**
- **Calibrate with spectroscopy**

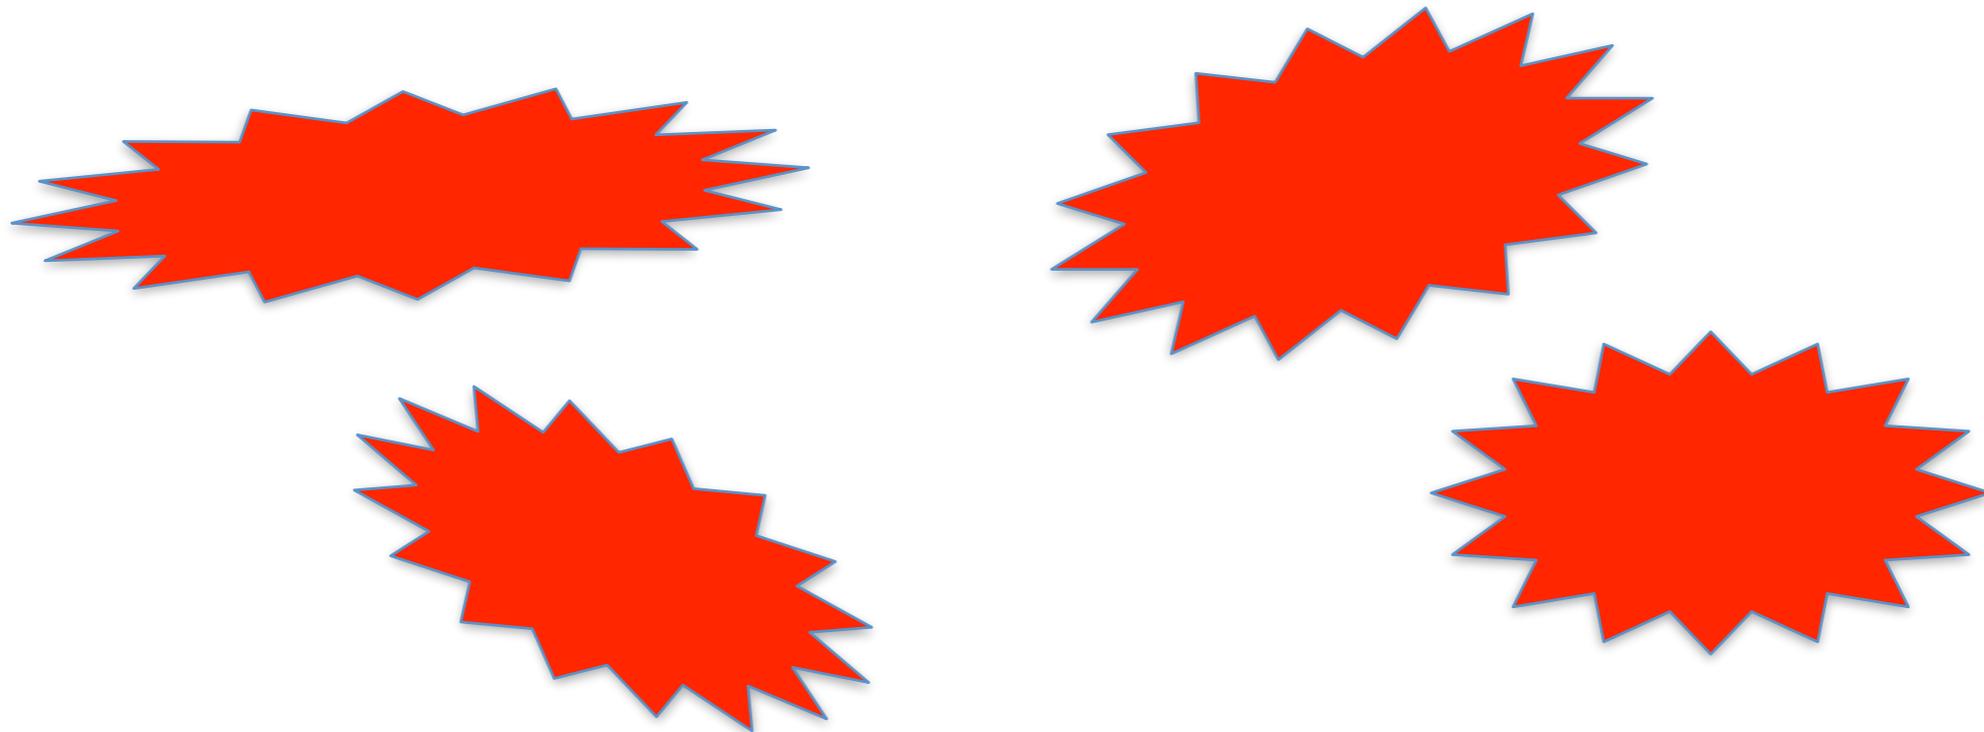

# Photo-z

- **Photo-z codes estimate  $z$** 
  - Or better still  $p(z)$
- **Get  $n(z)$  of bin of galaxies**
- **Calibrate with spectroscopy**

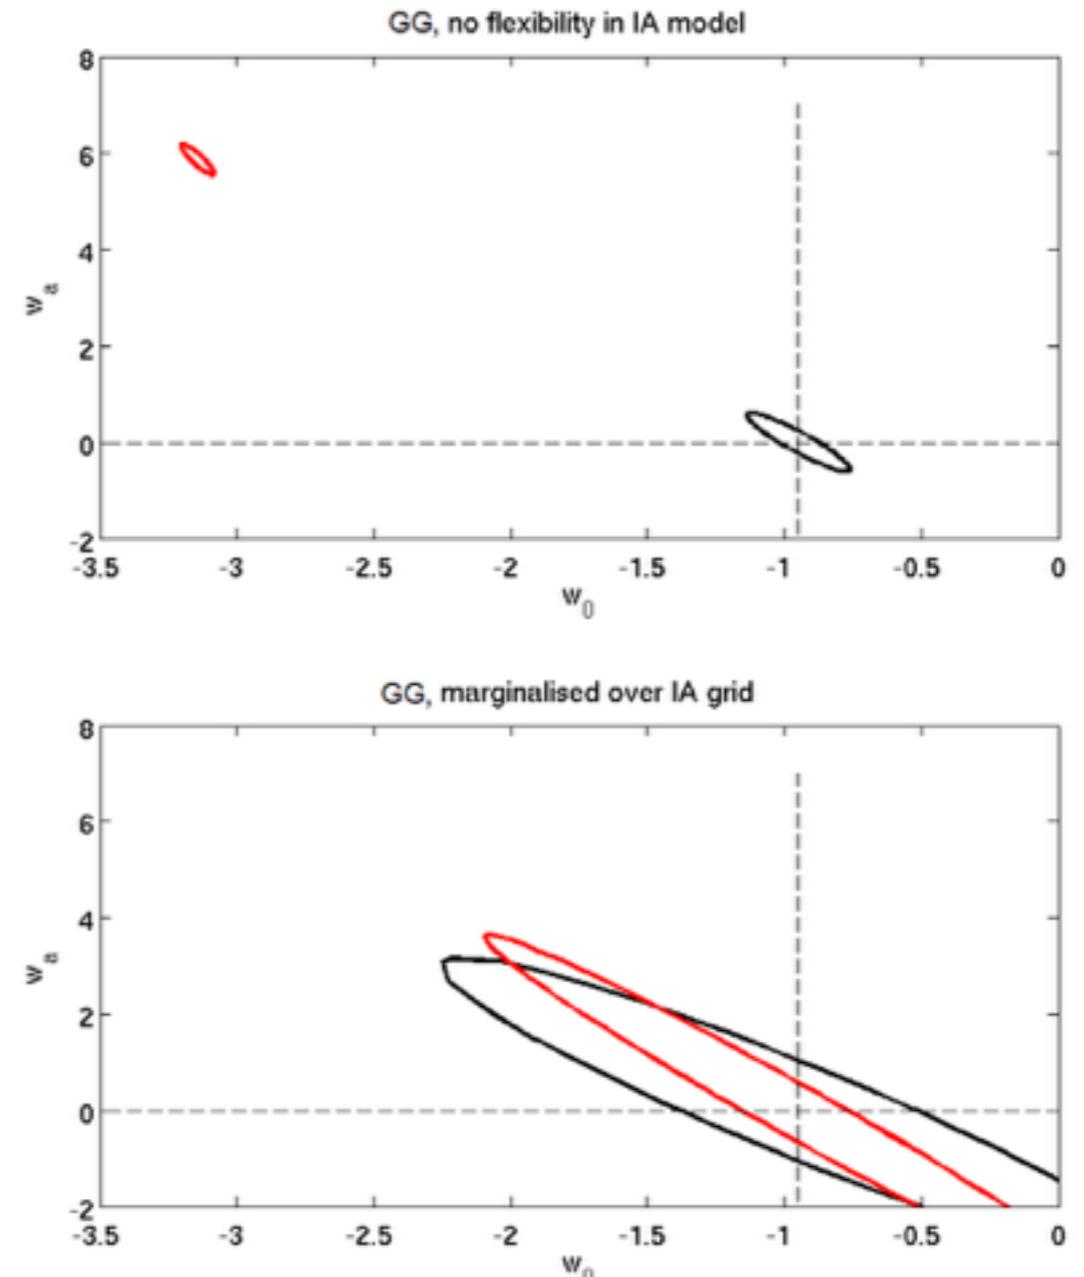

# Intrinsic Alignments

- **Before lensing, galaxies already aligned with each other**

# Intrinsic Alignments

- Review: Troxel & Ishak
- Linear & Nonlinear Alignment models
  - Assume laid down at early times ~ linear
  - Extensible
- Can certainly mitigate using density spectra

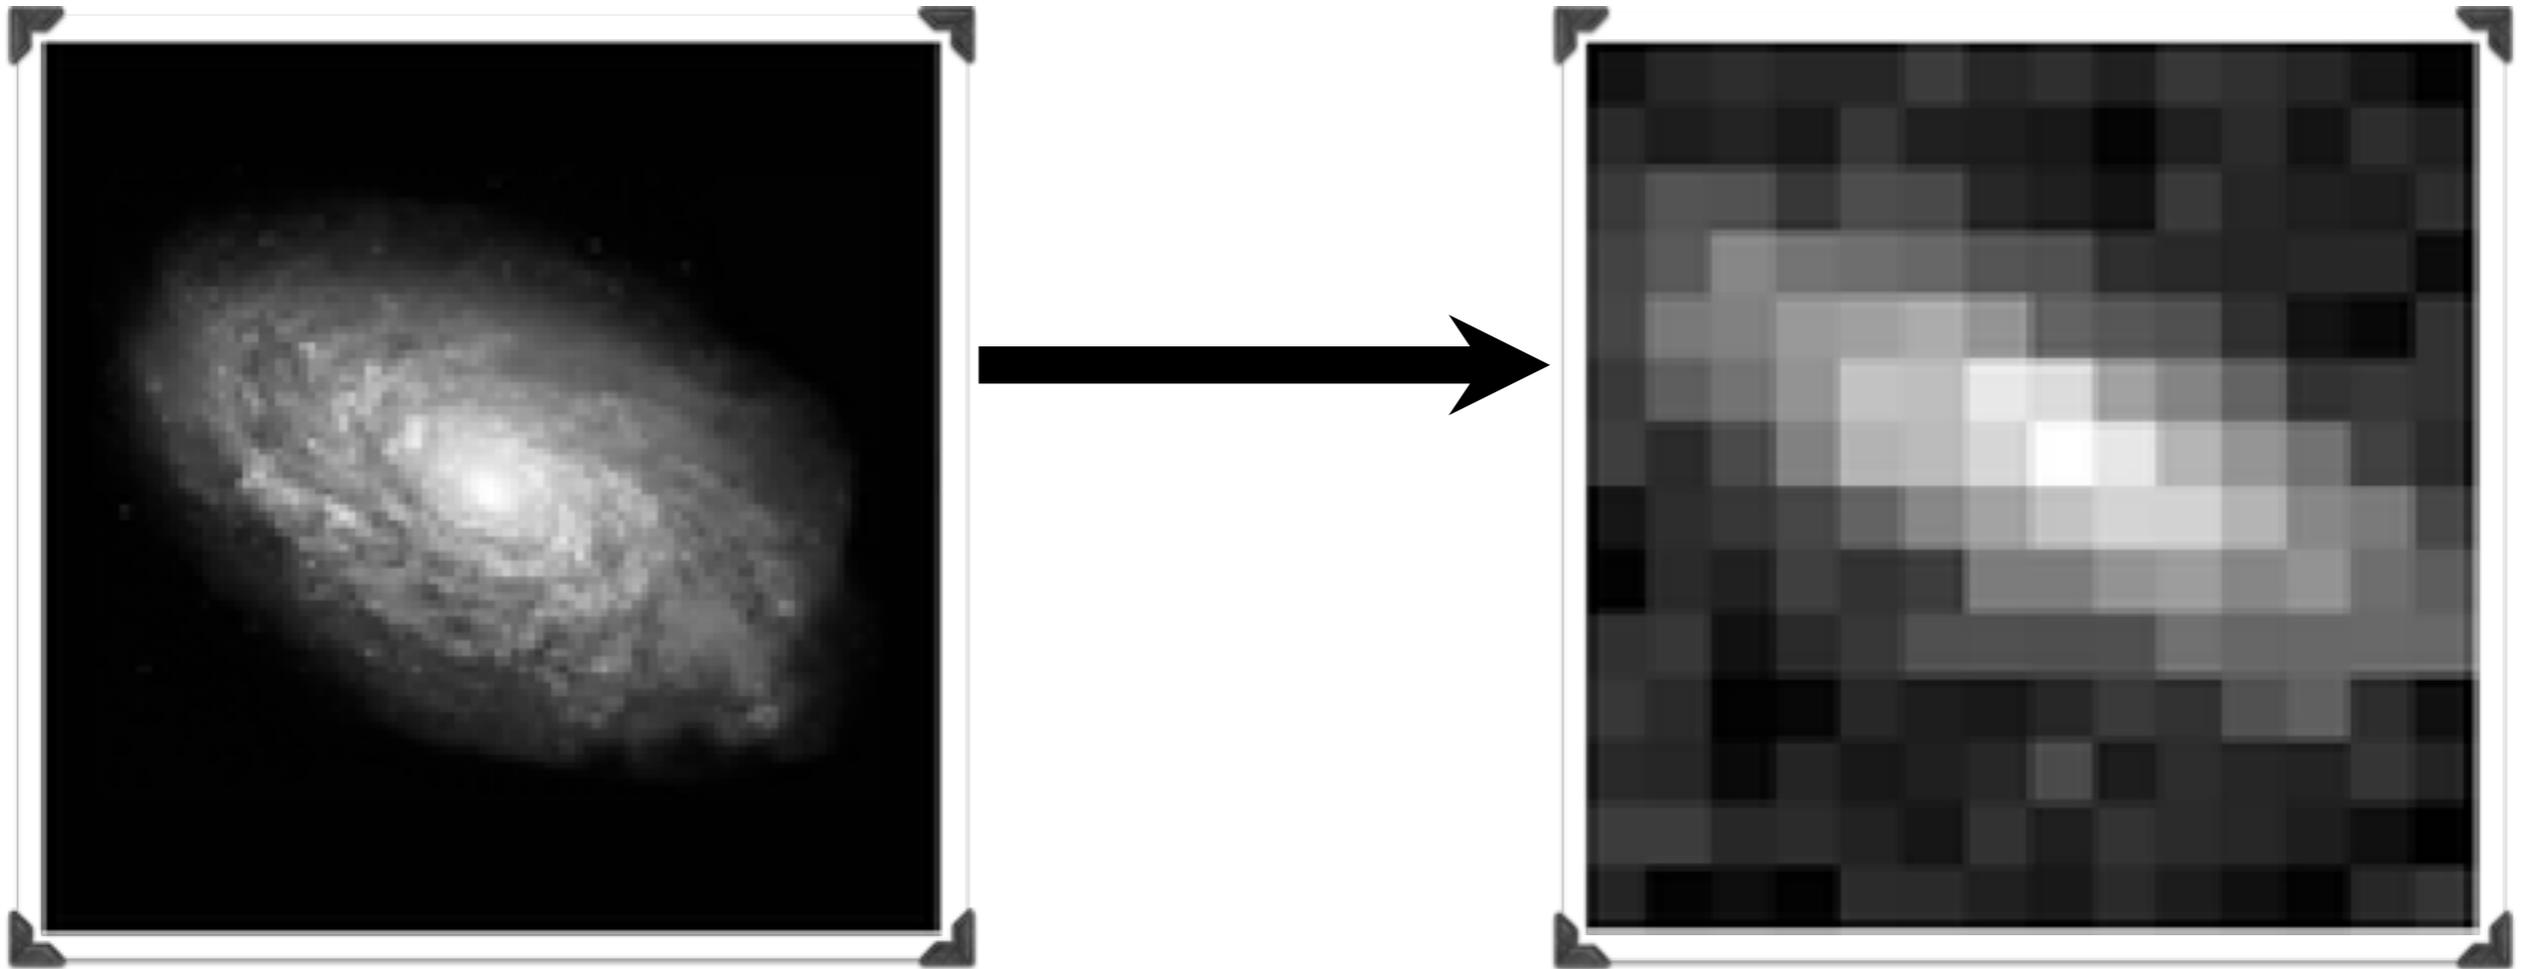

# Intrinsic Alignments

- **Linear alignment model**
  - Assume galaxy orientations laid down during linear era
- **One parameter – correlation amplitude**
  - Can extend

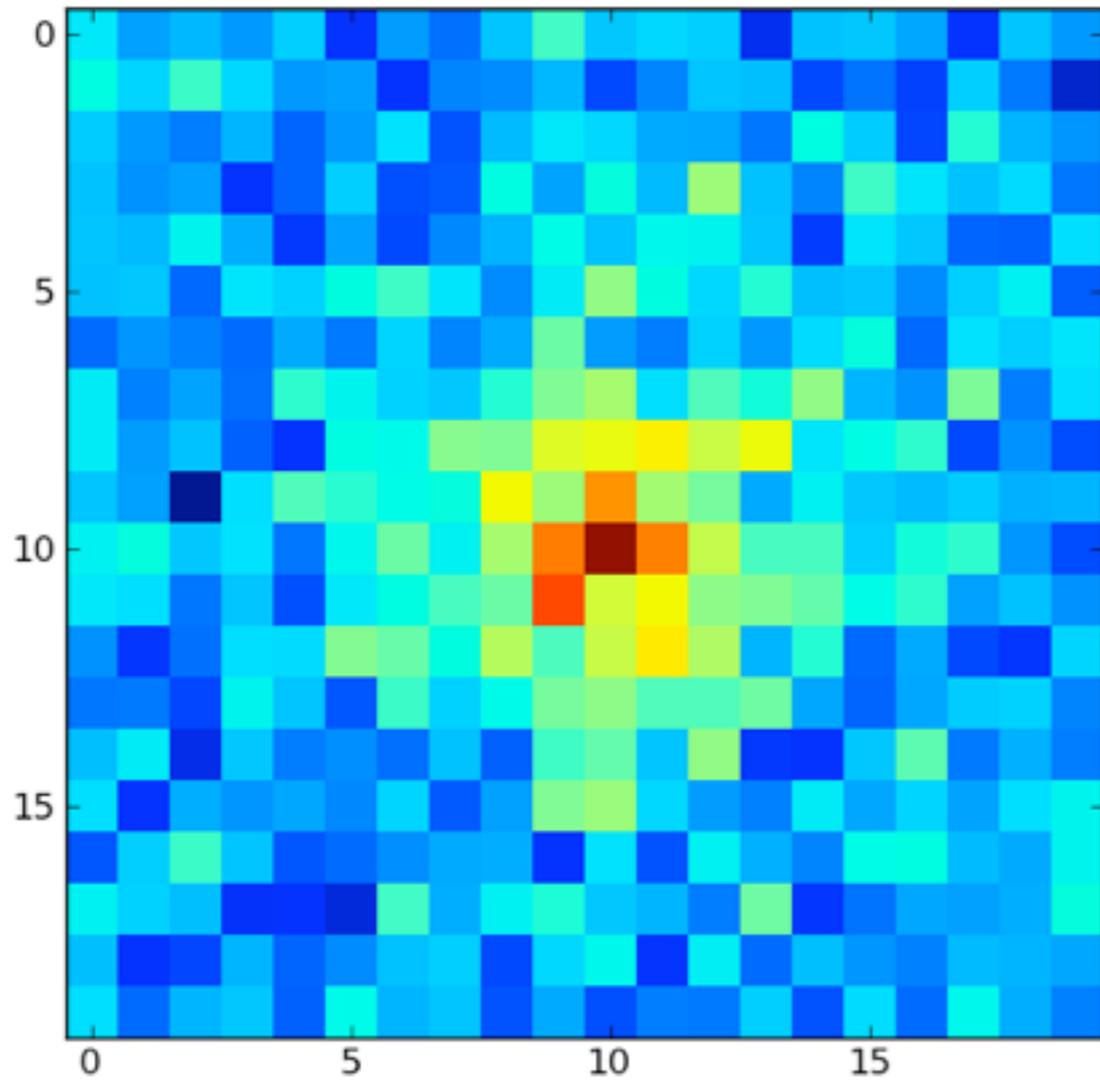

$$C_l = C_l^{gg} + C_l^{gi} + C_l^{ii}$$

# Shape Measurement

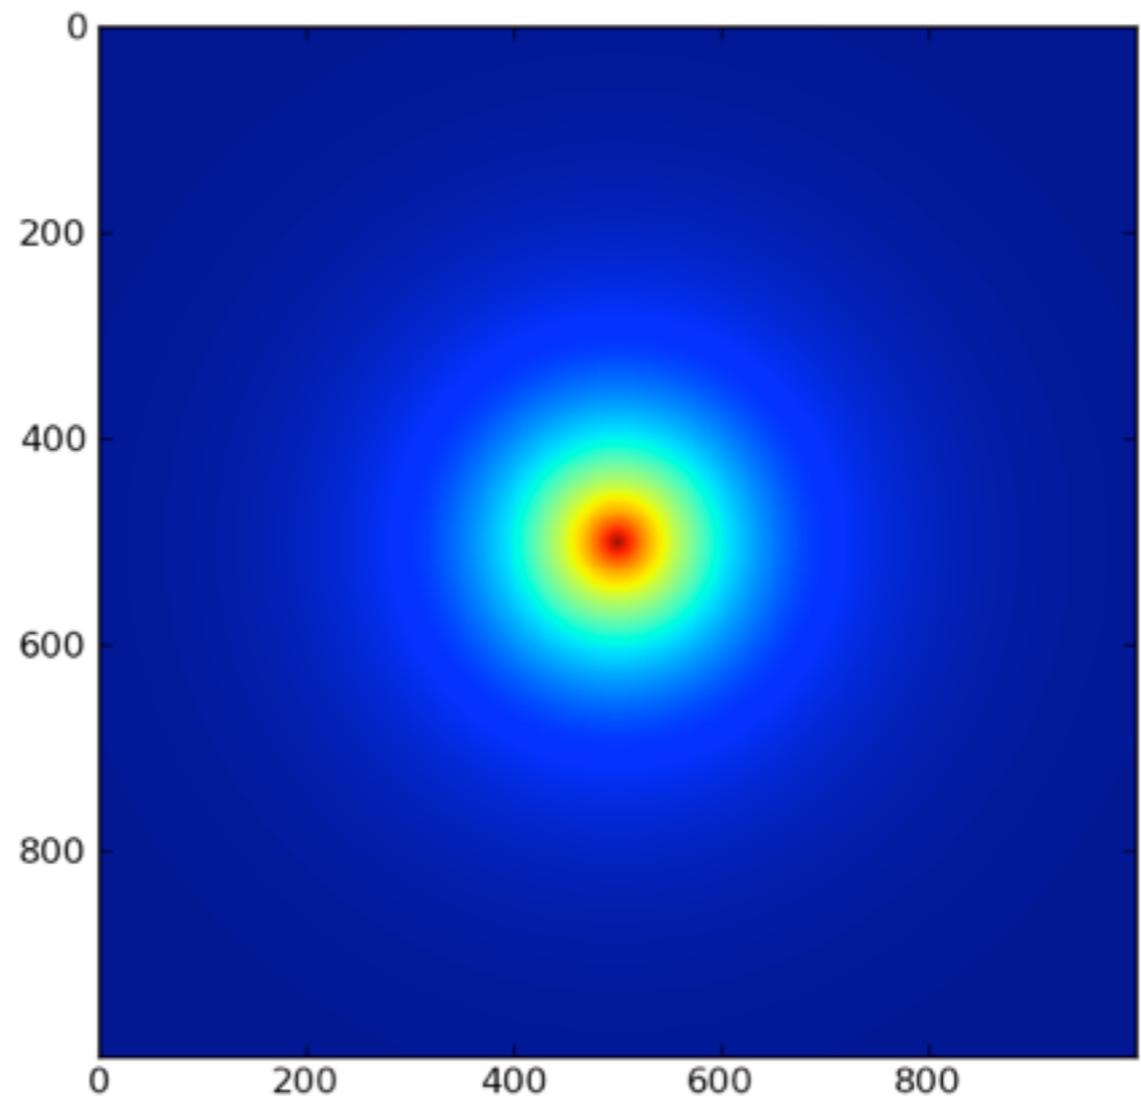

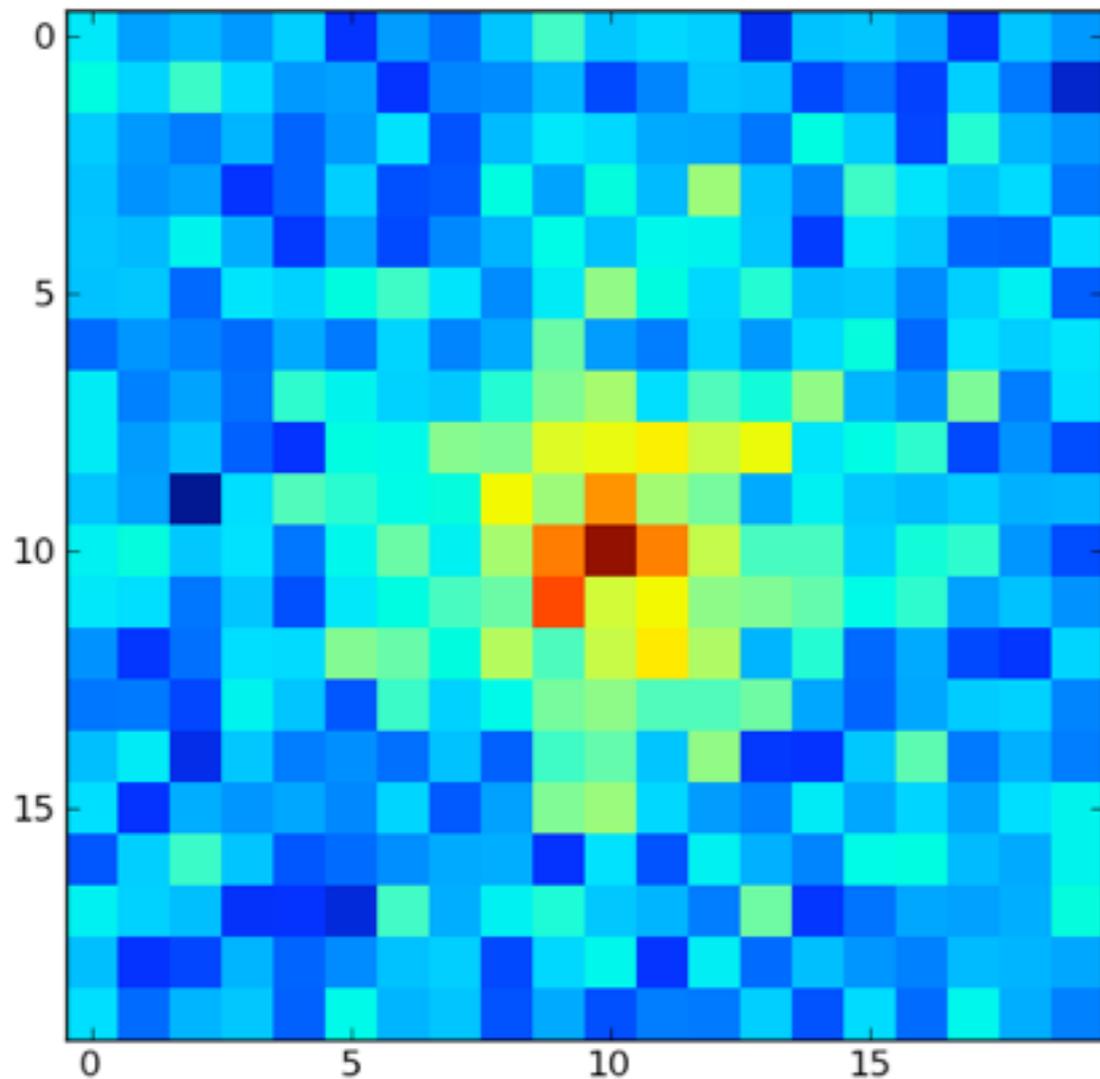

**Galaxy with shear, PSF,  
pixelization and noise**

# Requirements

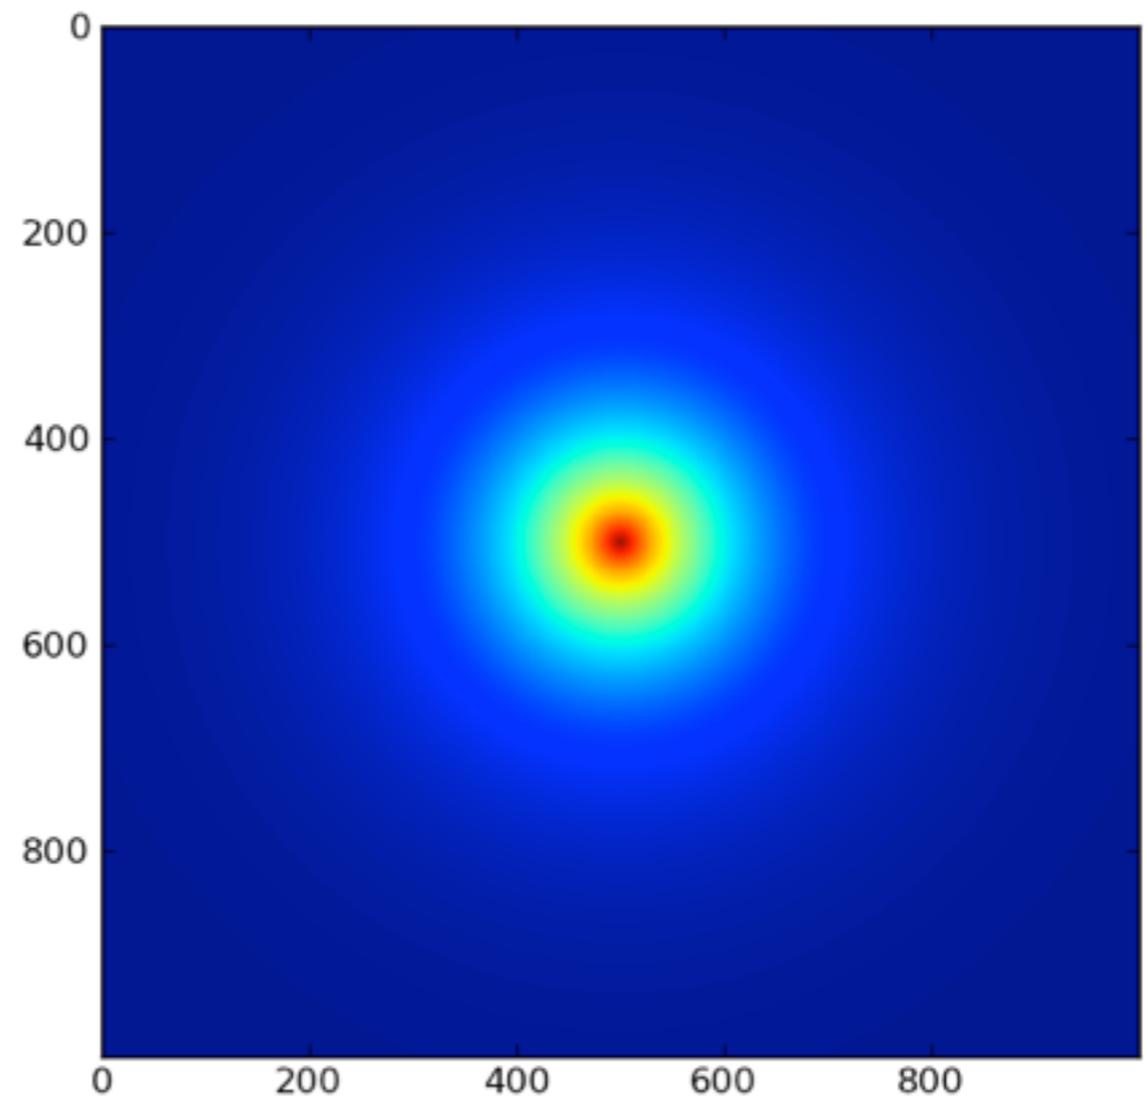

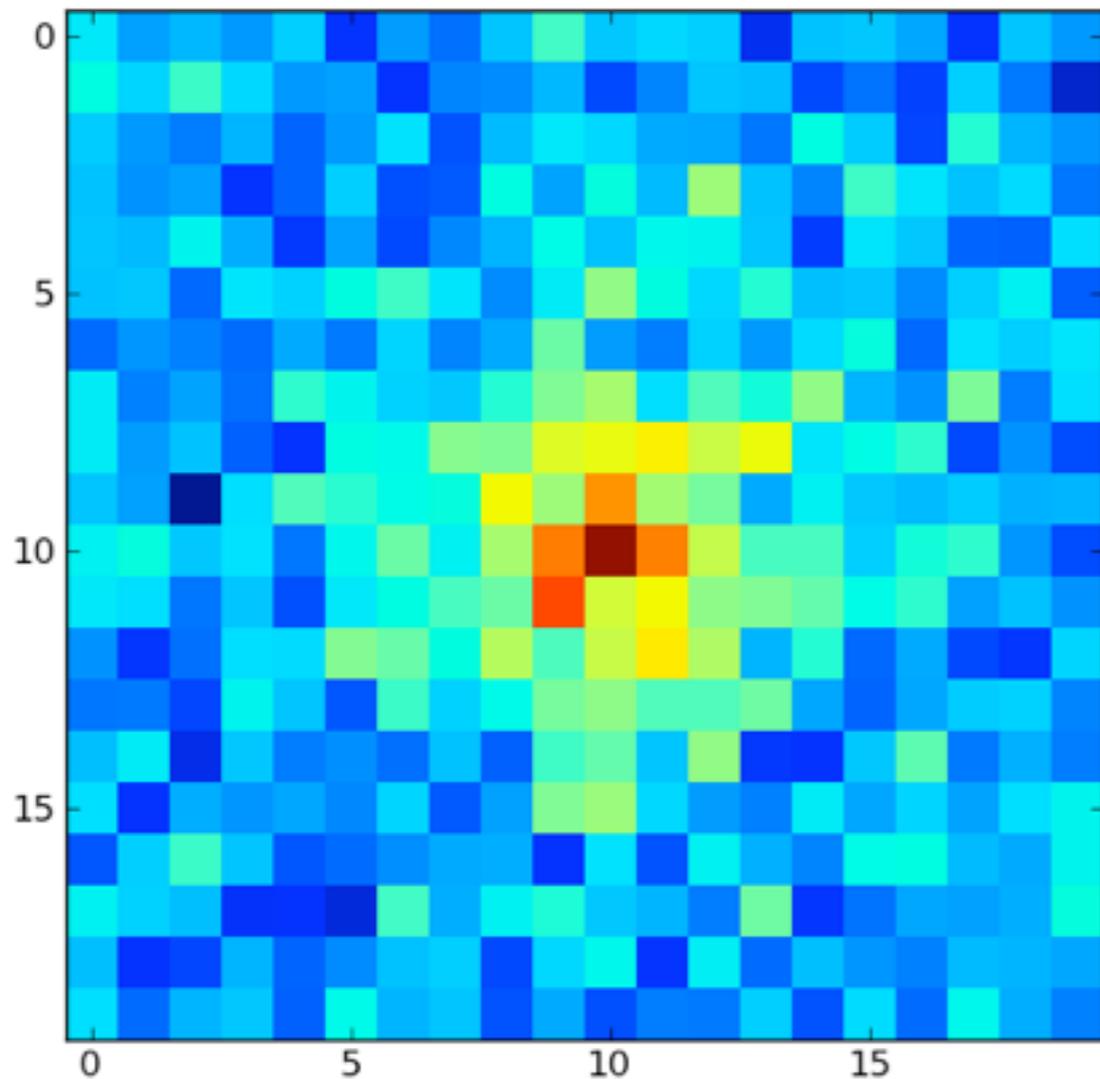

# Requirements

**Nobel Prize-Worthy Discovery**

# Requirements

**Very Embarrassing Retraction**

# Basic Galaxy Model

**Exponential  
Disc**

$$\exp - (x^T M x)^{\frac{1}{2}}$$

# Basic Galaxy Model

De  
Vaucouleurs  
Bulge

$$\exp - (x^T M x)^{\frac{1}{8}}$$

# Im3shape

- **Fit with Levenberg-Marquadt**
- **PSF and Image at high res**
- **Deal with bias from resolution**
- **Calibrate bias from noise**
- **Consider bias from wrong model**
- **Model error effect on shear spectrum with a few parameters**

Thank you
