From sum-integrals to continuum integrals and back

York Schröder (UBB Chillán)

based on recent work with Andrei Davydychev

and earlier work with I. Ghişoiu, J. Möller

ICTP-SAIFR, São Paulo, 30 Sep 2019

- Finite-temperature field theory

 - relevant in cosmology (mostly weak int; QCD as background) early univ, equilibration, $T_{max} = ?$ DM searches, relic densities
 - ▶ relevant in HIC (mainly QCD) fireball lifetime $\sim 10 \text{ fm/c}$; $T_{max} \sim 10^2 \text{ MeV}$ particle yields, jet quenching, plasma hydro
- ullet equilibrium thermodynamics: imaginary time formalism, $t \to i au$
 - ightharpoonup (grand) canonical ensemble, $Z(T,\mu)=\mathrm{Tr}[e^{-(\hat{H}-\mu\hat{N})/T}]$
 - ightharpoonup path int quant, fields periodic: $Z = \int \mathcal{D}\phi \ e^{-\int_0^{1/T} d\tau \int d^d x \ \mathcal{L}_E}$ $\qquad \Leftarrow \boxed{d = 3 2\varepsilon}$
 - ▶ Fourier trafo discrete; mom-space measure $T \sum_{n \in \mathbb{Z}} \int \frac{d^d p}{(2\pi)^d} \equiv \oint_P$
 - \triangleright bosonic prop $\sim [(2n\pi T)^2 + \vec{p}^2 + m^2]^{-1}$
 - ightharpoonup Dirac prop $\sim [i\gamma_0((2n+1)\pi T + i\mu) + i\vec{\gamma}\vec{p} + m]^{-1}$
- upshot: integrals \rightarrow sum-integrals

- clean sub-problem: vacuum-type sum-integrals
 - ightharpoonup relevance: free energy $f = -T \ln Z$ of a thermal system
 - ▶ EoS, expansion rate, etc.
 - ▶ in many settings, QCD effects dominant

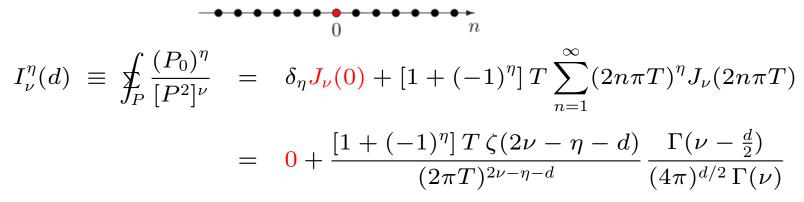

[Linde/IR problem tamed by EFT's]

- even cleaner: massless bosonic (think gluons) vacuum-type sum-integrals
 - ▶ state-of-the-art: 1-, 2-loop OK; 3-loop; isolated 4loop cases.

• first example: LO / 1-loop bosonic tadpole

• recall
$$T = 0$$
 case: $J_{\nu}(m) \equiv \int \frac{d^d p}{(2\pi)^d} \frac{1}{[p^2 + m^2]^{\nu}} = [m^2]^{d/2 - \nu} \times \frac{\Gamma(\nu - d/2)}{(4\pi)^{d/2} \Gamma(\nu)}$

• at $T \neq 0$ therefore [writing $P^2 = P_0^2 + \vec{p}^2$ with $P_0 = 2n\pi T$, and d-dim vector \vec{p}]

- ightharpoonup note that 'thermal part' has the form $\zeta(n_{
 m even}-d)$
- massless sum-integral \Leftrightarrow massive (T=0) integral
- relevance: free E, selfE's, Debye screening masses, etc.
 - ▶ example: blackbody radiation / Stefan-Boltzmann law at LO

$$f_{QED} = -\frac{\pi^2 T^4}{90} [2 + 4\frac{7}{8}N_f]$$

$$f_{QCD} = -\frac{\pi^2 T^4}{90} [2(N_c^2 - 1) + 4N_c\frac{7}{8}N_f]$$

 $[\leftrightarrow \text{ expansion rate of univ at } T \sim \text{MeV}]$

- next step: NLO / 2-loop
 - ▶ a number of worked-out examples in the literature
 - \triangleright general observation: factorization $\oint_{PQ} (\cdots) \sim [\oint_{P} (\cdots)] \times [\oint_{Q} (\cdots)]$
 - ▶ confirmed by (thermal adaptation) of IBP
 - ightharpoonup \Rightarrow Q: is this a theorem?

[A: YES (for bos, $m = \mu = 0$)]

- at higher orders (or with $\frac{1}{\varepsilon}$ from IBP pre-factors) need higher ε -terms of 2-loop sum-ints
 - \triangleright generic analytic results (in d) would be useful
- goal: devise a constructive proof of 2-loop factorization

Setup

- recall from 1-loop: massless sum-integral \Leftrightarrow massive (T=0) integral
- define massive 2-loop vacuum integral in d dimensions [we are interested in $d = 3 2\varepsilon$]

$$B_{m_1,m_2,m_3}^{\nu_1,\nu_2,\nu_3} \ \equiv \ \int \!\! \frac{d^dp}{(2\pi)^d} \! \int \!\! \frac{d^dq}{(2\pi)^d} \frac{1}{[m_1^2+p^2]^{\nu_1} \, [m_2^2+q^2]^{\nu_2} \, [m_3^2+(p-q)^2]^{\nu_3}}$$

• define massless bosonic 2-loop vacuum sum-integral $[\nu \equiv \nu_1 + \nu_2 + \nu_3 \text{ and } \eta \equiv \eta_1 + \eta_2 + \eta_3]$

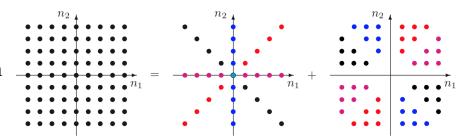

$$L_{\nu_{1},\nu_{2},\nu_{3}}^{\eta_{1},\eta_{2},\eta_{3}} \equiv \oint_{PQ} \frac{(P_{0})^{\eta_{1}} (Q_{0})^{\eta_{2}} (P_{0} - Q_{0})^{\eta_{3}}}{[P^{2}]^{\nu_{1}} [Q^{2}]^{\nu_{2}} [(P - Q)^{2}]^{\nu_{3}}}$$

$$= \frac{T^{2}}{(2\pi T)^{2\nu - \eta - 2d}} \sum_{n_{1},n_{2} \in \mathbb{Z}} n_{1}^{\eta_{1}} n_{2}^{\eta_{2}} (n_{1} - n_{2})^{\eta_{3}} B_{n_{1},n_{2},n_{1} - n_{2}}^{\nu_{1},\nu_{2},\nu_{3}}$$

 \bullet remaining task: do double sum over known analytic result for B

- [Davydychev/Tausk 1992]
- \triangleright known result is in terms of Appell's hypergeometric function F_4
- ▶ not practical: four infinite sums
- can do (much) better: 'masses' are linearly related \Rightarrow finite sums
 - \triangleright examine B from scratch, at special kinematic point

Setup

- sort out the cases where masses of B can vanish
 - ▶ decompose double-sum into sectors where 'masses' are always positive
 - \triangleright take into account that B depends on m_i^2 , use the integral's symmetry

$$\begin{split} L_{\nu_{1},\nu_{2},\nu_{3}}^{\eta_{1},\eta_{2},\eta_{3}} &= \frac{T^{2}\left[1+(-1)^{\eta}\right]}{(2\pi T)^{2\nu-\eta-2d}} \left\{ \frac{1}{2} \, \delta\eta_{1} \delta\eta_{2} \delta\eta_{3} \, B_{0,0,0}^{\nu_{1}\nu_{2}\nu_{3}} \right. \\ &+ \left. \left. \left. \left. \left(2\nu-\eta-2d \right) \left[(-)^{\eta_{3}} \delta\eta_{1} B_{0,1,1}^{\nu_{1},\nu_{2},\nu_{3}} + \delta\eta_{2} B_{0,1,1}^{\nu_{2},\nu_{1},\nu_{3}} + \delta\eta_{3} B_{0,1,1}^{\nu_{3},\nu_{1},\nu_{2}} + 2^{\eta_{3}} (-)^{\eta_{2}} B_{1,1,2}^{\nu_{1},\nu_{2},\nu_{3}} \right] \right. \\ &+ \left. \left. \bar{H}_{\eta_{3},\eta_{2},\eta_{1}}^{\nu_{3},\nu_{2},\nu_{1}} + (-)^{\eta_{3}} \bar{H}_{\eta_{3},\eta_{1},\eta_{2}}^{\nu_{3},\nu_{1},\nu_{2}} + (-)^{\eta_{2}} H_{\eta_{2},\eta_{1},\eta_{3}}^{\nu_{2},\nu_{1},\nu_{3}} + (-)^{\eta_{2}} H_{\eta_{1},\eta_{2},\eta_{3}}^{\nu_{1},\nu_{2},\nu_{3}} \right\} \end{split}$$

- 1st line: zero-scale case of $B \to \text{massless tadpole}$, = 0 in dim reg
- 2nd line: single-scale cases of B, double sum trivial $\rightarrow \zeta$

[explicit results not needed here]

• 3rd line: two types of double sums, each over B with $m_1 + m_2 = m_3$

$$H_{\eta a, \eta_b, \eta_c}^{\nu a, \nu_b, \nu_c} \equiv \sum_{\substack{n_1 > n_2 > 0}} n_1^{\eta a} n_2^{\eta_b} (n_1 + n_2)^{\eta_c} B_{n_1, n_2, n_1 + n_2}^{\nu a, \nu_b, \nu_c}$$

$$\bar{H}_{\eta a, \eta_b, \eta_c}^{\nu a, \nu_b, \nu_c} \equiv \sum_{\substack{n_1 > n_2 > 0}} (n_1 - n_2)^{\eta a} n_2^{\eta_b} n_1^{\eta_c} B_{n_1 - n_2, n_2, n_1}^{\nu a, \nu_b, \nu_c}$$

Continuum integral B

- recall: need 2-loop massive vacuum integral $B_{m_1,m_2,m_3}^{\nu_1,\nu_2,\nu_3}$ at $m_3=m_1+m_2$ (all $m_i>0$)
- IBP gives a recurrence that allows to shrink one line

[Tarasov 1997]

$$2uB^{\nu_1\nu_2\nu_3} = \left\{ \frac{1}{m_1} \left[\frac{c + \nu_2}{m_2} - \frac{c + \nu_3}{m_3} \right] + \frac{2}{m_2} \left[\frac{c + \nu_1}{m_1} - \frac{c + \nu_3}{m_3} \right] + \frac{3}{m_3} \left[\frac{c - \nu_1}{m_1} + \frac{c - \nu_2}{m_2} \right] \right\} B^{\nu_1\nu_2\nu_3}$$

$$[u \equiv d+3-2\nu \text{ and } c \equiv d+2-\nu \text{ as well as } \nu=\nu_1+\nu_2+\nu_3]$$

- can one solve this explicitly?
 - ightharpoonup trivial boundary cond: $B^{000} = 0$, $B^{\nu_1 00} = 0$, $B^{\nu_1 \nu_2 0} = J_{\nu_1}(m_1) J_{\nu_2}(m_2)$ etc.
 - ▶ no systematic method known for three-dimensional recurrence relations
- experimental math: look at some low (index-) weight examples

$$B^{111} = \frac{(d-2)}{2(d-3)} \left\{ -\frac{B^{011}}{m_2 m_3} - \frac{B^{101}}{m_1 m_3} + \frac{B^{110}}{m_1 m_2} \right\}$$

$$B^{211} = \frac{(d-2)}{4(d-5)} \left\{ \frac{B^{011}}{m_2^2 m_3^2} + \left[(d-4)\frac{m_3}{m_1} - 1 \right] \frac{B^{101}}{m_1^2 m_3^2} - \left[(d-4)\frac{m_2}{m_1} + 1 \right] \frac{B^{110}}{m_1^2 m_2^2} \right\}$$

Continuum integral B

ullet observe lots of structure \Rightarrow boldly conjecture the full result

$$B^{\nu_1\nu_2\nu_3} \stackrel{?!}{=} B^{110}_{110} \sum_{j=1-\nu_1}^{\nu_2-1} (-1)^{\nu} c^{(\nu)}_{\nu_1,\nu_2;j} m_1^{d-\nu+j} m_2^{d-\nu-j} + (231) + (312)$$

- ightharpoonup coefficients $c_{\nu_a,\nu_b;j}^{(
 u)}$ are rational functions in d
- $\qquad \underline{\text{symmetries}} \ c_{\nu_a,\nu_b;j}^{(\nu)} = c_{\nu_b,\nu_a;-j}^{(\nu)} \ (\text{with special case} \ c_{\nu_a,\nu_b;0}^{(\nu)} = c_{\nu_b,\nu_a;0}^{(\nu)})$
- ▶ conjecture confirmed via recurrence to weight 18
- ullet conjecture proven via induction over weight u

[details in forthcoming paper]

- relying on the IBP recurrence
- ▶ lots of rearrangements of sums; add cleverly constructed zero
- \triangleright proof is constructive: gives fast algorithm to recursively construct c's
- at higher ν , c's contain huge numerator polynomials; plus lots of structure not shown here
- obtained some interesting new analytic results, e.g. for B^{aac} and perms, such as

$$B^{aac} = \sum_{k=0}^{a-1} \operatorname{rat}_{k}^{ac}(d) \left\{ \frac{B^{110}}{(m_{1}m_{2})^{2a+c-2}} \frac{(m_{1}+m_{2})^{2k}}{(m_{1}m_{2})^{k}} + \sum_{j=0}^{c+k-1} \operatorname{rat}_{kj}^{ac}(d) \left[\frac{B^{101}}{(m_{1}m_{3})^{2a+c-2}} \left(\frac{m_{1}}{m_{3}} \right)^{j-k} + (1 \leftrightarrow 2) \right] \right\}$$

- \triangleright needed B^{11c} as derived directly from corresponding limit of F_4 representation
- ▶ coeffs rat known analytically

Continuum integral B

- to fix c's in practice, yet another recurrence is most useful (= fast)
- mixing a number of IBP and dimensional relations

[extracted from Tarasov 1997]

$$(d-2)(d+3-2\nu)B^{\nu_1,\nu_2,\nu_3}(d) = \lambda(\mathbb{1}^-, \mathbb{2}^-, \mathbb{3}^-) dl^- B^{\nu_1,\nu_2,\nu_3}(d)$$

$$\lambda(a,b,c) = a^2 + b^2 + c^2 - 2(ab+bc+ca)$$

$$dl^- B^{\nu_1,\nu_2,\nu_3}(d) = \frac{1}{16\pi^2} B^{\nu_1,\nu_2,\nu_3}(d-2)$$

- \triangleright reduces the weight ν by two in each step; price: changes d
- \triangleright use until one $\nu_i \to 0$ or -1
- ▶ lift the neg. index via $\mathbf{3}^- B^{\nu_1,\nu_2,0} = \{2m_1m_2 + \mathbf{1}^- + \mathbf{2}^-\} B^{\nu_1,\nu_2,0}$ and perms
- > recurrence does not contain explicit mass-factors
- \triangleright know the boundary integrals for arbitrary dimension d
- there is much more to be discovered...
- ullet important: IBP rel asserts that B is polynomial in masses; allows to tackle sums

Back to sum-integrals

ullet reminder to self: wanted to evaluate two-loop sum-integral L

$$L_{\nu_{1},\nu_{2},\nu_{3}}^{\eta_{1},\eta_{2},\eta_{3}} \ = \ \frac{T^{2}[1+(-1)^{\eta}]}{(2\pi T)^{2\nu-\eta-2d}} \left\{ \frac{1}{2} \delta_{\eta_{1}} \delta_{\eta_{2}} \delta_{\eta_{3}} B_{0,0,0}^{\nu_{1}\nu_{2}\nu_{3}} \right. \\ + \ \left. \zeta(2\nu-\eta-2d) \left[(-)^{\eta_{3}} \delta_{\eta_{1}} B_{0,1,1}^{\nu_{1},\nu_{2},\nu_{3}} + \delta_{\eta_{2}} B_{0,1,1}^{\nu_{3},\nu_{1},\nu_{2}} + 2^{\eta_{3}} (-)^{\eta_{2}} B_{1,1,2}^{\nu_{1},\nu_{2},\nu_{3}} \right] \\ + \ \left. \bar{R}_{\eta_{3},\eta_{2},\eta_{1}}^{\nu_{3},\nu_{2},\nu_{1}} + (-)^{\eta_{3}} \bar{H}_{\eta_{3},\eta_{1},\eta_{2}}^{\nu_{3},\nu_{1},\nu_{2}} + (-)^{\eta_{2}} H_{\eta_{1},\eta_{2},\eta_{3}}^{\nu_{1},\nu_{2},\nu_{3}} + (-)^{\eta_{2}} H_{\eta_{1},\eta_{2},\eta_{3}}^{\nu_{1},\nu_{2},\nu_{3}} + (-)^{\eta_{2}} H_{\eta_{1},\eta_{2},\eta_{3}}^{\nu_{1},\nu_{2},\nu_{3}} \right\} \\ \bar{R}_{\eta_{3},\eta_{2},\eta_{1}}^{\nu_{1},\nu_{1}} + (-)^{\eta_{3}} \bar{H}_{\eta_{3},\eta_{1},\eta_{2}}^{\nu_{3},\nu_{1},\nu_{2}} + (-)^{\eta_{2}} H_{\eta_{2},\eta_{1},\eta_{3}}^{\nu_{1},\nu_{2},\nu_{3}} + (-)^{\eta_{2}} H_{\eta_{1},\eta_{2},\eta_{3}}^{\nu_{1},\nu_{2},\nu_{3}} \right\} \\ \bar{R}_{\eta_{3},\eta_{2},\eta_{1}}^{\nu_{1},\nu_{2},\nu_{1}} + (-)^{\eta_{3}} \bar{H}_{\eta_{3},\eta_{1},\eta_{2}}^{\nu_{3},\nu_{1},\nu_{2}} + (-)^{\eta_{2}} H_{\eta_{2},\eta_{1},\eta_{3}}^{\nu_{1},\nu_{2},\nu_{3}} + (-)^{\eta_{2}} H_{\eta_{1},\eta_{2},\eta_{3}}^{\nu_{1},\nu_{2},\nu_{3}} \right\} \\ \bar{R}_{\eta_{3},\eta_{2},\eta_{1}}^{\nu_{1},\nu_{2},\nu_{3}} + (-)^{\eta_{3}} \bar{H}_{\eta_{3},\eta_{1},\eta_{2}}^{\nu_{3},\nu_{1},\nu_{3}} + (-)^{\eta_{2}} H_{\eta_{1},\eta_{2},\eta_{3}}^{\nu_{1},\nu_{2},\nu_{3}} \right\} \\ \bar{R}_{\eta_{3},\eta_{2},\eta_{1}}^{\nu_{3},\nu_{2},\nu_{1}} + (-)^{\eta_{3}} \bar{H}_{\eta_{3},\eta_{1},\eta_{2}}^{\nu_{3},\nu_{1},\nu_{3}} + (-)^{\eta_{2}} H_{\eta_{1},\eta_{2},\eta_{3}}^{\nu_{1},\nu_{2},\nu_{3}} \right] \\ \bar{R}_{\eta_{3},\eta_{2},\eta_{1}}^{\nu_{3},\nu_{2},\nu_{1}} + (-)^{\eta_{3}} \bar{H}_{\eta_{3},\eta_{1},\eta_{2}}^{\nu_{3},\nu_{1},\nu_{3}} + (-)^{\eta_{2}} H_{\eta_{1},\eta_{2},\eta_{3}}^{\nu_{1},\nu_{2},\nu_{3}} \right] \\ \bar{R}_{\eta_{3},\eta_{2},\eta_{1}}^{\nu_{3},\nu_{2},\nu_{1}} + (-)^{\eta_{3}} \bar{H}_{\eta_{3},\eta_{1},\eta_{2}}^{\nu_{2},\nu_{1},\eta_{3}}^{\nu_{3}} + (-)^{\eta_{2}} H_{\eta_{1},\eta_{2},\eta_{2},\eta_{3}}^{\nu_{3},\nu_{2},\nu_{2},\nu_{3}} \right] \\ \bar{R}_{\eta_{3},\eta_{2},\eta_{1}}^{\nu_{3},\nu_{2},\nu_{2}} + (-)^{\eta_{3}} \bar{H}_{\eta_{3},\eta_{1},\eta_{2}}^{\nu_{2},\nu_{1},\eta_{3}} + (-)^{\eta_{2}} \bar{H}_{\eta_{1},\eta_{2},\eta_{2},\eta_{3}}^{\nu_{3},\nu_{2},\nu_{2},\nu_{3}} \right] \\ \bar{R}_{\eta_{3},\eta_{2},\eta_{1}}^{\nu_{3},\nu_{2},\nu_{2},\nu_{3}}^{\nu_{3},\nu_{3},\nu_{3},\nu_{3},\nu_{3},\nu_{3},\nu_{3},\nu_{3},\nu_{3},\nu_{3},\nu_{3},\nu_{3},\nu_{3$$

- ightharpoonup need to to perform the remaining (Matsubara) double sums H, \bar{H}
- \triangleright having the 'conjecture' at hand, the mass structure of B is explicit
- \triangleright can work out the sums without specifying the coefficient functions c(d)
- we will now show how the sums combine to
 - (a) evaluate to single and double zeta values only
 - (b) cancel all $\zeta(i,j)$ in the sum of all four terms of 3rd line of L-decomposition
 - (c) cancel all remaining single $\zeta(i)$ in 2nd line of L-decomposition
 - (d) leave us with products $\zeta(i)\,\zeta(j)$ containing only $\zeta(n_{\mathrm{even}}-d)$
- all of this allows us to write a compact final result, containing products of 1-loop tadpoles

proof of statement (a)

- show that double sums evaluate to MZV only
- use the 'conjecture' for H
 - re-express the 'unwanted mass' in the prefactor in terms of the two others (introduces an additional binomial sum)
 - \triangleright shift summation indices and use c-symmetries $[\det \ell_i \equiv \nu \eta_i j k]$

$$\frac{H_{\eta_2\eta_1\eta_3}^{\nu_2\nu_1\nu_3} + H_{\eta_1\eta_2\eta_3}^{\nu_1\nu_2\nu_3}}{B_{110}^{110}}$$

$$= \sum_{j=1-\nu_1}^{\nu_2-1} (-1)^{\nu} c_{\nu_1,\nu_2;j}^{(\nu)} \sum_{k=0}^{\eta_3} {\eta_3 \choose k} \sum_{n_1>n_2>0} \left(n_2^{d-\ell_1} n_1^{d-2\nu+\eta+\ell_1} + n_1^{d-\ell_1} n_2^{d-2\nu+\eta+\ell_1} \right) + (231) + (312)$$

• this contains only two combinations of double sums

[1st instance contains non-MZV, cancels in sum]

$$\sum_{n_1 > n_2 > 0} \left(\frac{1}{n_1^{\alpha}} + \frac{1}{n_2^{\alpha}} \right) \frac{1}{(n_1 + n_2)^{\beta}} = \zeta(\beta, \alpha) - \frac{1}{2\beta} \zeta(\alpha + \beta)$$

$$\sum_{n_1 > n_2 > 0} \left(\frac{1}{n_1^{\alpha}} \frac{1}{n_2^{\beta}} + \frac{1}{n_2^{\alpha}} \frac{1}{n_1^{\beta}} \right) = \zeta(\alpha)\zeta(\beta) - \zeta(\alpha + \beta)$$

proof of statement (b)

- show that no MZV's contribute
- massaging \bar{H} as above

$$\frac{\bar{H}_{\eta_3\eta_2\eta_1}^{\nu_3\nu_2\nu_1}}{B_{110}^{110}} = \sum_{j=1-\nu_1}^{\nu_2-1} (-1)^j c_{\nu_1,\nu_2;j}^{(\nu)} \sum_{k=0}^{\eta_3} {\eta_3 \choose k} (-1)^{k-\eta_3} \sum_{n_1>n_2>0} n_2^{d-2\nu+\eta+\ell_1} n_1^{d-\ell_1} + (231) + (312)$$

• double sums results in multiple zeta values $[\det \ell_i = \nu - \eta_i - j - k, d_i = \ell_i - d \text{ and } e_i = 2\nu - d - \eta - \ell_1]$

$$\frac{\bar{H}_{\eta_{3}\eta_{2}\eta_{1}}^{\nu_{3}\nu_{2}\nu_{1}} + (-1)^{\eta_{3}}\bar{H}_{\eta_{3}\eta_{1}\eta_{2}}^{\nu_{3}\nu_{1}\nu_{2}} + (-1)^{\eta_{2}}[H_{\eta_{2}\eta_{1}\eta_{3}}^{\nu_{2}\nu_{1}\nu_{3}} + H_{\eta_{1}\eta_{2}\eta_{3}}^{\nu_{1}\nu_{2}\nu_{3}}]}{(-1)^{\nu}B_{110}^{110}}$$

$$= \sum_{j=1-\nu_1}^{\nu_2-1} c_{\nu_1,\nu_2;j}^{(\nu)} \sum_{k=0}^{\eta_3} {\eta_3 \choose k} \left\{ (-)^{\ell_3} \left[\zeta(d_1,e_1) + \zeta(e_1,d_1) \right] + (-)^{\eta_2} \left[\zeta(e_1)\zeta(d_1) - \zeta(e_1+d_1) \right] \right\} + (231) + (312)$$

• simplify via shuffle rel $\zeta(a,b) + \zeta(b,a) = \zeta(a)\zeta(b) - \zeta(a+b)$

$$\frac{\bar{H}_{\eta_{3}\eta_{2}\eta_{1}}^{\nu_{3}\nu_{2}\nu_{1}}+(-1)^{\eta_{3}}\bar{H}_{\eta_{3}\eta_{1}\eta_{2}}^{\nu_{3}\nu_{1}\nu_{2}}+(-1)^{\eta_{2}}[H_{\eta_{2}\eta_{1}\eta_{3}}^{\nu_{2}\nu_{1}\nu_{3}}+H_{\eta_{1}\eta_{2}\eta_{3}}^{\nu_{1}\nu_{2}\nu_{3}}]}{(-1)^{\nu}\,B_{110}^{110}}$$

$$= \sum_{j=1-\nu_1}^{\nu_2-1} c_{\nu_1,\nu_2;j}^{(\nu)} \sum_{k=0}^{\eta_3} {\eta_3 \choose k} \left\{ \left[(-1)^{\ell_3} + (-1)^{\eta_2} \right] \left[\zeta(e_1)\zeta(d_1) - \zeta(e_1 + d_1) \right] \right\} + (231) + (312)$$

proof of statement (c)

- show that only products of single zeta values remain in L
- happy with the products of zetas (hints at 1-loop squared)
- remaining single zetas have arguments $e_i + d_i = 2\nu 2d \eta \Rightarrow \text{pull out of sums}$ k-sums are trivial: $\sum_{k=0}^{N} {N \choose k} x^k = (1+x)^N$, $\sum_{k=0}^{N} {N \choose k} (-1)^k = \delta_N$
 - \triangleright j-sum can then be seen to be nothing but the coefficients of single-scale cases of B

$$\begin{split} & \left. \bar{H}_{\eta_{3}\eta_{2}\eta_{1}}^{\nu_{3}\nu_{2}\nu_{1}} + (-1)^{\eta_{3}} \bar{H}_{\eta_{3}\eta_{1}\eta_{2}}^{\nu_{3}\nu_{1}\nu_{2}} + (-1)^{\eta_{2}} [H_{\eta_{2}\eta_{1}\eta_{3}}^{\nu_{2}\nu_{1}\nu_{3}} + H_{\eta_{1}\eta_{2}\eta_{3}}^{\nu_{1}\nu_{2}\nu_{3}}] \right|_{\text{single zetas}} \\ & = \left. -\zeta(2\nu - 2d - \eta) \left(-1 \right)^{\nu} B_{110}^{110} \sum_{j=1-\nu_{1}}^{\nu_{2}-1} c_{\nu_{1},\nu_{2};j}^{(\nu)} \left[(-1)^{\nu - \eta_{3} - j} \delta_{\eta_{3}} + (-1)^{\eta_{2}} 2^{\eta_{3}} \right] + (231) + (312) \\ & = \left. -\zeta(2\nu - 2d - \eta) \left[\delta_{\eta_{3}} B_{011}^{\nu_{3}\nu_{1}\nu_{2}} + \delta_{\eta_{2}} B_{011}^{\nu_{2}\nu_{1}\nu_{3}} + (-1)^{\eta_{2}} \delta_{\eta_{1}} B_{011}^{\nu_{1}\nu_{2}\nu_{3}} + (-1)^{\eta_{2}} 2^{\eta_{3}} B_{112}^{\nu_{1}\nu_{2}\nu_{3}} \right] \end{split}$$

cancels exactly against the 2nd line of L-decomposition

proof of statement (d)

- show that only $\zeta(n-d)$ at even integers n contribute
- \bullet re-write the specific combinations of prefactors $\ [\text{using } \ell_i \equiv \nu \eta_i j k]$

$$L_{\nu_{1}\nu_{2}\nu_{3}}^{\eta_{1}\eta_{2}\eta_{3}} = \frac{T^{2}[1+(-1)^{\eta}]}{(2\pi T)^{2\nu-\eta-2d}} B_{110}^{110} \times \\ \times \sum_{j=1-\nu_{1}}^{\nu_{2}-1} (-1)^{\nu} c_{\nu_{1},\nu_{2};j}^{(\nu)} \sum_{k=0}^{\eta_{3}} {\eta_{3} \choose k} (-1)^{\eta_{2}} [1+(-1)^{\ell_{1}}] \zeta(\ell_{1}-d) \zeta(2\nu-\eta-\ell_{1}-d) \\ + (231) + (312)$$

• normalization factor $B_{110}^{110} \equiv \frac{\Gamma^2(1-d/2)}{(4\pi)^d} \equiv [J_1(d)]^2$

Result

• convert $\zeta \to 1$ -loop sum-ints I_{ν}^{η} [use $\sigma_n \equiv \text{Max}[n, 1]$ to take care of numerators]

$$\zeta(2n-d) = \frac{\left(2\pi T\right)^{2n-d}}{T\,J_1(d)}\,\hat{I}_n \;, \quad \text{with 1-loop sum-int} \qquad \hat{I}_n \equiv \frac{\Gamma(\sigma_n)}{2\left(1-\frac{d}{2}\right)_{\sigma_n-1}}\,I_{\sigma_n}^{2\sigma_n-2n}$$

• final result [recall $\nu = \nu_1 + \nu_2 + \nu_3$, $\eta = \eta_1 + \eta_2 + \eta_3$ and $\ell_i = \nu - \eta_i - j - k$]

$$\mathcal{L}_{\nu_{1}\nu_{2}\nu_{3}}^{\eta_{1}\eta_{2}\eta_{3}} = \left[1 + (-1)^{\eta}\right] \sum_{j=1-\nu_{1}}^{\nu_{2}-1} (-1)^{\nu} c_{\nu_{1},\nu_{2};j}^{(\nu)} \sum_{k=0}^{\eta_{3}} {\eta_{3} \choose k} (-1)^{\eta_{2}} \left[1 + (-1)^{\ell_{1}}\right] \hat{I}_{\underline{\ell_{1}}} \hat{I}_{\underline{2\nu-\eta-\ell_{1}}} + (231) + (312)$$

• some examples (checks against literature, and new):

$$\begin{array}{lll} L_{111}^{000} & = & 0 \\ \\ L_{211}^{220} & = & -\frac{(d-4)(d^2-8d+19)}{4(d-7)(d-5)} I_2^0 I_1^0 \\ \\ L_{114}^{000} & = & -\frac{4 I_3^0 I_3^0}{(d-9)(d-7)(d-4)(d-2)} - \frac{6 I_2^0 I_4^0}{(d-9)(d-2)} \\ \\ L_{116}^{000} & = & -\frac{36 I_4^0 I_4^0}{(d-13)(d-11)(d-9)(d-6)(d-4)(d-2)} - \frac{48 I_3^0 I_5^0}{(d-13)(d-11)(d-4)(d-2)} - \frac{10 I_2^0 I_6^0}{(d-13)(d-2)} \end{array}$$

Outlook

- thermal field theory: phenomenologically relevant for cosmology and HIC
 - > perturbative tools (by far) not as well developed/automatized as for collider physics
 - ▶ here: first derivation of a parametric IBP solution
- massless 2-loop vacuum-type sum-integrals completely understood
 - \triangleright get closed form for coeffs c? (those are from simple continuum integrals)
- generalizations of 2-loop case?
 - > massless fermions
 - ▶ massive particles (different game: not even massive 1-loop sum-int known analytically)
 - ▶ chemical potentials
- generalizations to higher loops?
 - ▶ some strikingly simple relations known via IBP
 e.g. 3-loop massless benz-type sum-integral vanishes
 - \triangleright other known ε -expansions of 3-loop masters show more complicated structure
 - \triangleright useful to exploit known properties of 3d massive integrals at T=0?
 - ▶ few useful analytic results available
