Francesco D'Eramo

The Big Question

What are the building blocks of our Universe?

The Big Question

What are the building blocks of our Universe?

Atomic theory by Democritus
(400 BC)

This question has been
around for a while!

A Very Slow Progress

1600's

Scientific method by G. Galilei

1800

Experimental evidence for atoms by J. Dalton

ELEMENTS										Plat. 3
Simple										
1	2	3	4	5	6	7	8	9		
										
10	11	12	13	14	15	16	17	18		
										
19	20	21	22	23	24	25	26	27		
										
28	29	30	31	32	33	34	35	36		
										

1897

Electron discovery by J.J. Thomson (atom not invisible!)

1911

Discovery of the nucleus by E. Rutherford

1970's

Zoo of elementary particles and the Standard Model

2012

Higgs boson discovery
(Standard Model is complete!)

A Magnificent Unified Description

A Magnificent Unified Description

Is the Game Over?

Have we finally found an answer to the question asked by Democritus more than 2000 years ago?

Can we declare victory?

Is the Game Over?

Have we finally found an answer to the question asked by Democritus more than 2000 years ago?

Can we declare victory?

No!

Dark Matter

Standard Model matter:
approximately 5% of the
current energy budget

Dark Matter

Standard Model matter:
approximately 5% of the
current energy budget

In this five lectures we deal with dark matter

We will review its evidence,
theories and experimental searches

Looking at the Invisible?

How can we be sure that dark matter exists?

Looking at the Invisible?

How can we be sure that dark matter exists?

Observe very carefully the
motion of visible objects

Using laws of gravity we find
the gravitational potential Φ

Looking at the Invisible?

How can we be sure that dark matter exists?

Observe very carefully the motion of visible objects

Using laws of gravity we find the gravitational potential Φ

Infer total amount of matter (visible and invisible)

$$\nabla^2 \Phi = -4\pi G_N \rho$$

Zwicky and the Coma Cluster

Fritz Zwicky (1930's)

Careful observation of galaxies
within the Coma Cluster

Two independent
measurement of the
cluster mass... surprise!

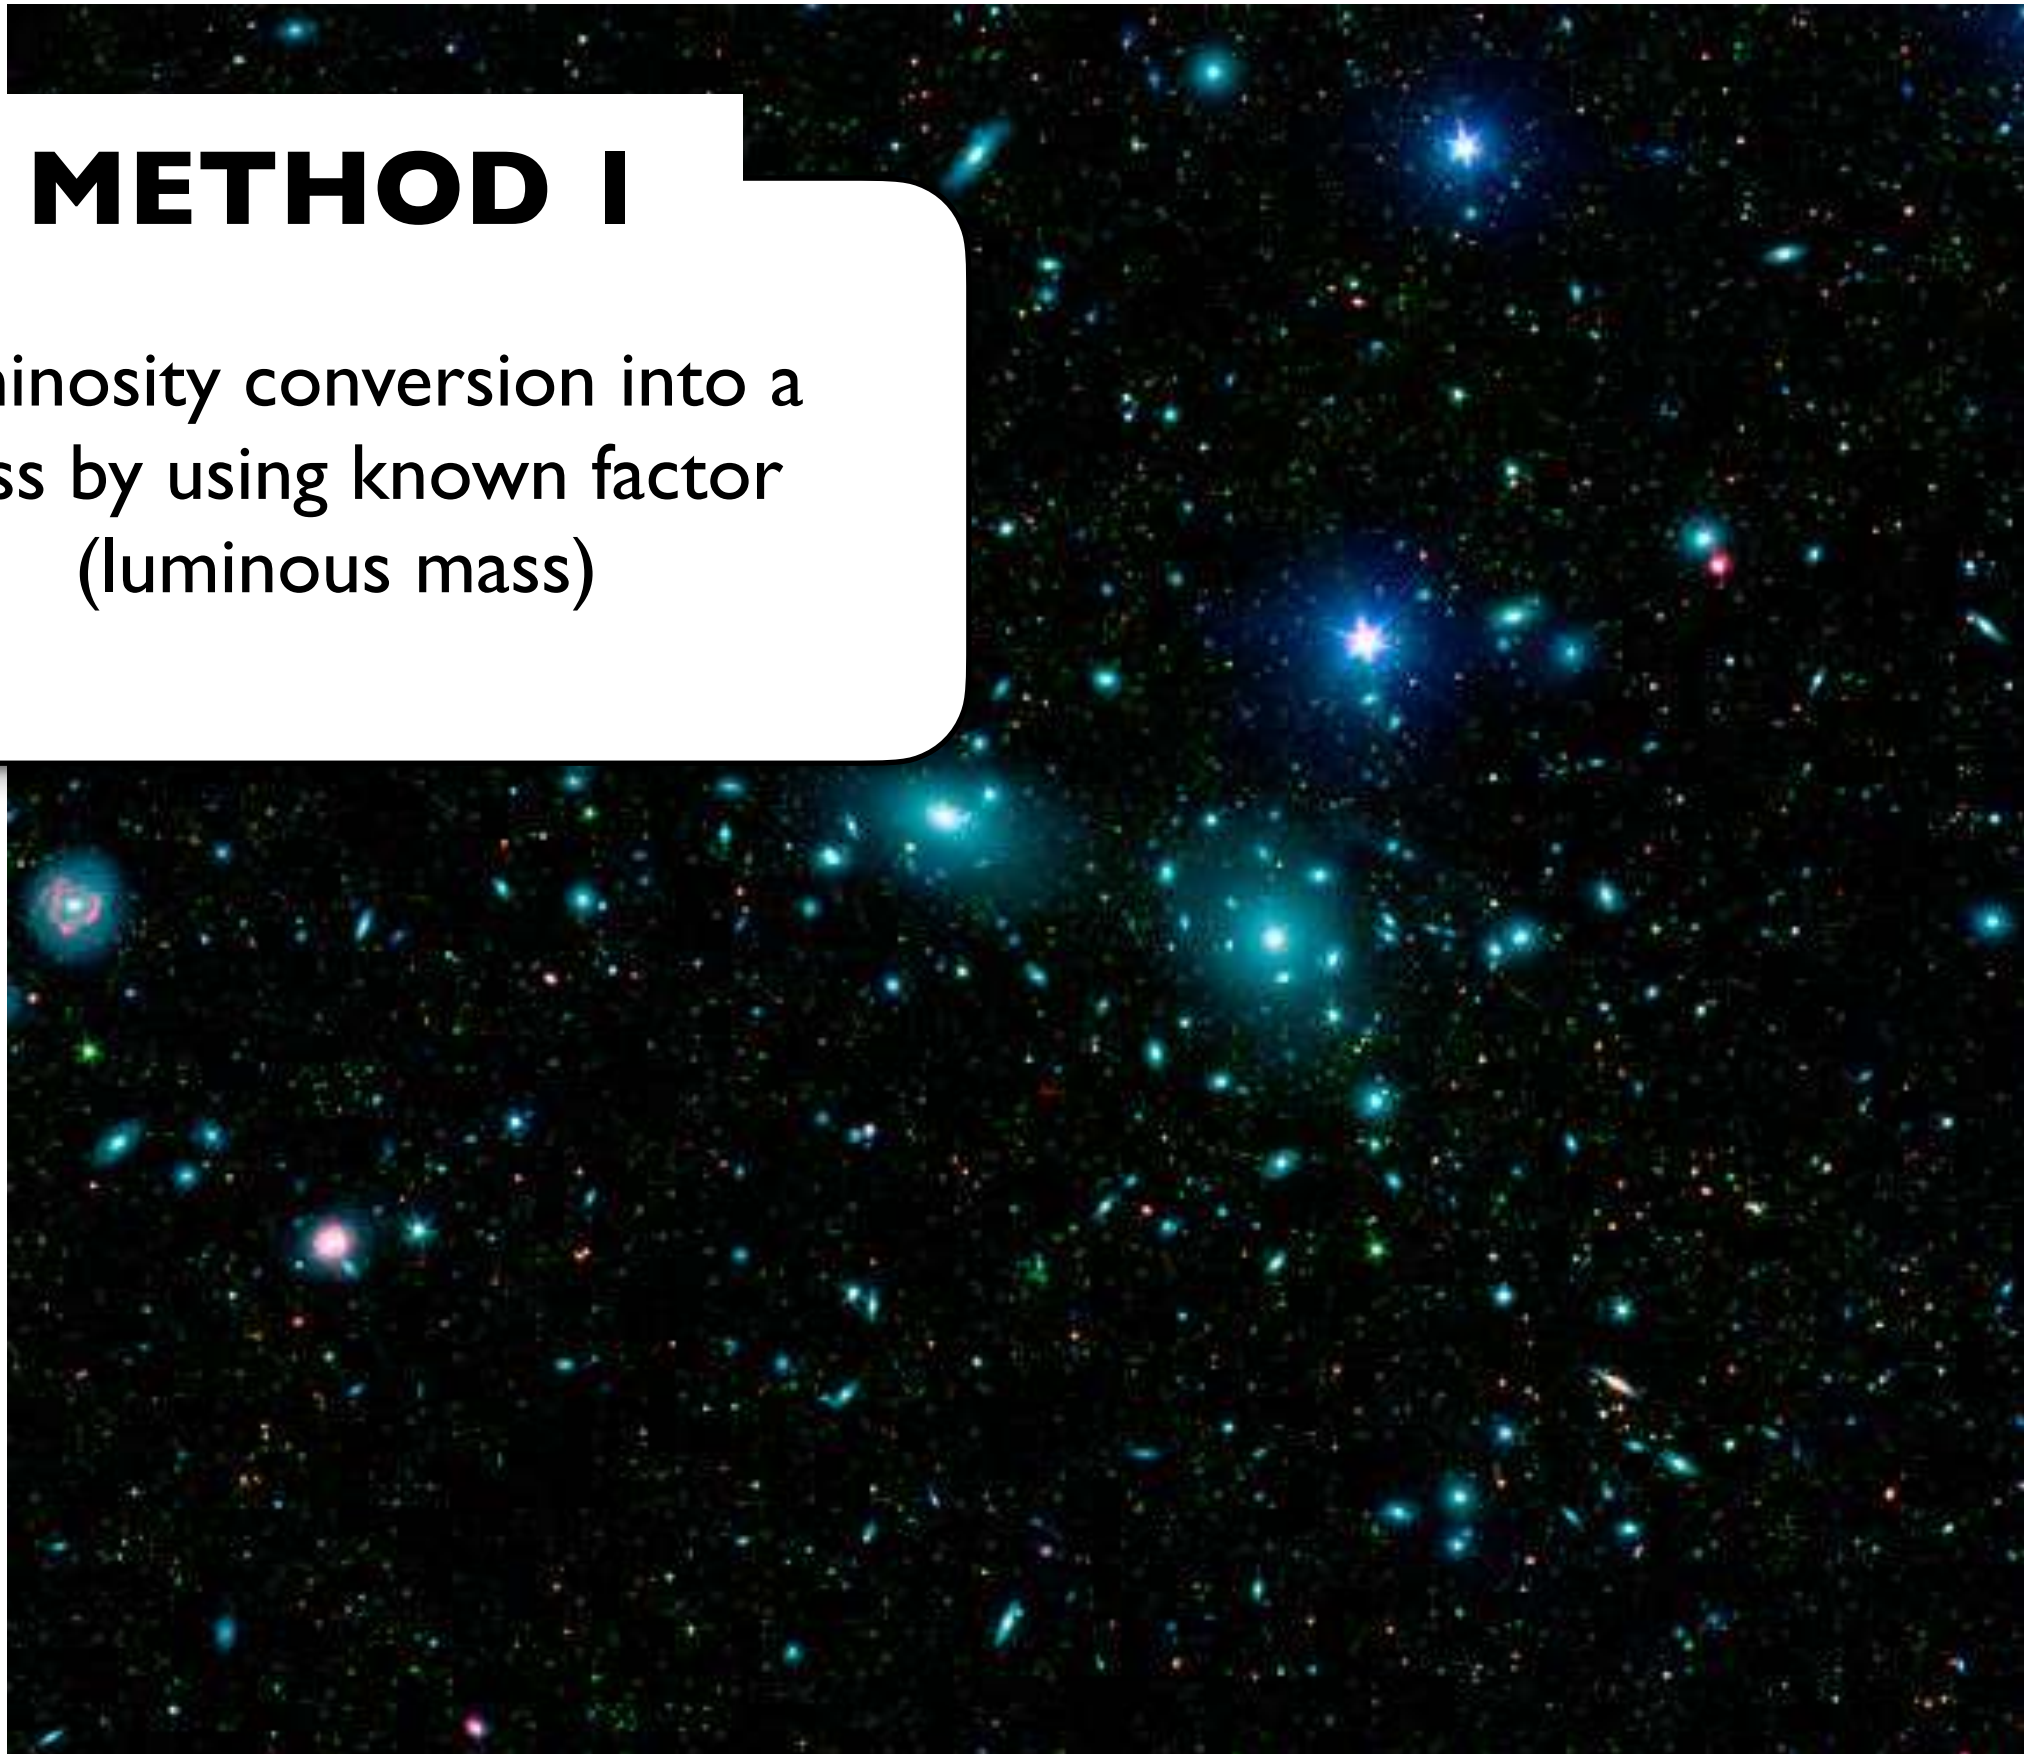

Zwicky and the Coma Cluster

Zwicky and the Coma Cluster

METHOD I

Luminosity conversion into a mass by using known factor
(luminous mass)

Zwicky and the Coma Cluster

METHOD I

Luminosity conversion into a mass by using known factor
(luminous mass)

METHOD II

Observation of galaxy velocities
and derivation of the potential
(gravitational mass)

PROBLEM I

Zwicky and the Coma Cluster

METHOD I

Luminosity conversion into a mass by using known factor
(luminous mass)

METHOD II

Observation of galaxy velocities and derivation of the potential
(gravitational mass)

PROBLEM I

Mass deficit!

$$M_{\text{Coma}}^{(grav)} \gg M_{\text{Coma}}^{(vis)}$$

Galactic Rotation Curves

Vera Rubin (1970's)

Careful observation of stellar motion within spiral galaxies

Comparison with
expectation based on
visible mass... surprise!

Galactic Rotation Curves

Galactic Rotation Curves

GOAL

$v(r)$

?

r

r

Galactic Rotation Curves

GOAL

PREDICTION

$$v(r) \propto \begin{cases} r & r \ll r_c \\ r^{-1/2} & r \gg r_c \end{cases}$$

Galactic Rotation Curves

A Dark Matter Halo

A Dark Matter Halo

$$m \frac{v^2(r)}{r} = \frac{G_N M(r) m}{r^2} \Rightarrow \rho_{\text{halo}} \propto r^{-2}$$

A Dark Matter Halo

$$m \frac{v^2(r)}{r} = \frac{G_N M(r) m}{r^2} \Rightarrow \rho_{\text{halo}} \propto r^{-2}$$

N-body simulations

Isothermal: $\rho_{\text{DM}}^{\text{isothermal}}(r) = \frac{\rho_0}{1 + (r/r_c)^2}$

NFW: $\rho_{\text{DM}}^{\text{NFW}}(r) = \frac{\rho_s}{(r/r_s)(1 + r/r_s)^2}$

Einasto: $\rho_{\text{DM}}^{\text{Einasto}}(r) = \rho_E \exp \left[-\frac{2}{\alpha} (r/r_E)^\alpha - 1 \right]$

Halo density profile for the Milky Way very important for indirect searches (later)

Firm evidence over decades

Rotation of galaxies

Velocities of galaxies in clusters

Velocities of stars in dwarf galaxies

Hot gas in galaxy clusters

Galaxy interactions

Collisions of galaxy clusters

Gravitational lensing

Gravitational Lensing

We can find evidence for dark matter even beyond the visible galactic disk

Hot gas in galaxy clusters

Clusters are filled with hot gas that does not fall within galaxies

We observe its X-ray emission

Hot gas in galaxy clusters

Clusters are filled with hot gas that does not fall within galaxies

We observe its X-ray emission

$$\frac{dp(r)}{dr} = - \frac{G_N M(r) \rho(r)}{r^2}$$

Hydrostatic equilibrium:

we can infer the distribution of gravitational mass

Cosmic Microwave Background

Universe 380,000 yrs old,
Temperature 0.3 eV,
Tiny density fluctuations

Species present @ CMB formation:
photons, neutrinos, electrons, protons, dark matter

Cosmic Microwave Background

Universe 380,000 yrs old,
Temperature 0.3 eV,
Tiny density fluctuations

Species present @ CMB formation:
photons, neutrinos, electrons, protons, dark matter

Cosmic Microwave Background

Universe 380,000 yrs old,
Temperature 0.3 eV,
Tiny density fluctuations

$$\rho_{\text{DM}} \simeq 5 \rho_B$$

Dark matter must
be non-baryonic!

Structure Formation

How did we go from a highly homogeneous and isotropic universe to galaxies and clusters?

Structure Formation

How did we go from a highly homogeneous and isotropic universe to galaxies and clusters?

GRAVITATIONAL COLLAPSE

$$\frac{\delta \rho}{\rho} \propto \begin{cases} \ln(a) & \text{RD} \\ a & \text{MD} \end{cases}$$

Structure Formation

How did we go from a highly homogeneous and isotropic universe to galaxies and clusters?

BARYONS ONLY

$$\left. \frac{\delta \rho}{\rho} \right|_{\text{today}} \simeq \left. \frac{\delta \rho}{\rho} \right|_{\text{CMB}} \frac{a_0}{a_{\text{rec}}} \simeq 10^{-5} \times 10^3 \simeq 10^{-2}$$

Structure Formation

How did we go from a highly homogeneous and isotropic universe to galaxies and clusters?

Structure formation can reach the non-linear regime only if there is dark matter!

The Big Question in 2020

What is the dark matter made of?

Dark Matter

In these lectures I will tell you about possible ideas that could end up in that t-shirt

We cannot put anything we want:
solid bounds from dark matter searches

What dark matter cannot be

RELIC DENSITY

$$\Omega_{DM}(t_0)h^2 = \frac{\rho_{DM}}{\rho_{\text{crit}}/h^2} = 0.1198 \pm 0.0012$$

What dark matter cannot be

RELIC DENSITY

$$\xi_{DM} = \frac{\rho_{DM}}{s(t_0)} = \frac{m_{DM} n_{DM}}{s(t_0)} = m_{DM} Y_{DM} \simeq 4.35 \times 10^{-10} \text{ GeV}$$

What dark matter cannot be

Reproduce the relic density

MASS BOUNDS

BOSON DM:

de Broglie wavelength smaller
than dwarf galaxies size

$$\lambda_{DM} = \frac{h}{p} \simeq \left(\frac{1 \text{ eV}}{m_{DM}} \right) 2.3 \times 10^{-3} \text{ m}$$

$$m_{DM} \gtrsim 10^{-22} \text{ eV}$$

What dark matter cannot be

Reproduce the relic density

MASS BOUNDS

FERMION DM:

Tremaine-Gunn bound
(Pauli exclusion principle)

$$m_{\text{DM}} \gtrsim \left(\frac{9\pi}{4\sqrt{2}g} \frac{1}{\sqrt{MG^3 R^3}} \right)^{1/4} \\ \gtrsim (10 - 100) \text{ eV}$$

PROBLEM 2

What dark matter cannot be

Reproduce the relic density

“Statistical” bounds on the mass

CHARGE NEUTRAL

Searches for
DM-electron
bound states

$$q_{\text{DM}} \simeq \begin{cases} 10^{-6} \\ 10^{-4} \end{cases} \quad \begin{matrix} m_{\text{DM}} = 10 \text{ GeV} \\ m_{\text{DM}} = 10 \text{ TeV} \end{matrix}$$

What dark matter cannot be

Reproduce the relic density

“Statistical” bounds on the mass

Charge neutrality

COLDNESS

Cosmological structures study:

DM particles must have been non-relativistic when
the universe had a temperature $T \sim 1 \text{ keV}$

This excludes hot relics (next lecture)

What dark matter cannot be

Reproduce the relic density

“Statistical” bounds on the mass

Charge neutrality

Cold relics

Self-Interactions

$$\frac{\sigma_{\text{self}}}{m} \lesssim 1 \frac{\text{cm}^2}{\text{g}}$$

What dark matter cannot be

Reproduce the relic density

“Statistical” bounds on the mass

Charge neutrality

Cold relics

Self-Interactions

$$\frac{\sigma_{\text{self}}}{m} \lesssim 10^{-24} \text{cm}^2 \text{TeV}^{-1}$$

What dark matter cannot be

Reproduce the relic density

“Statistical” bounds on the mass

Charge neutrality

Cold relics

Not too-much self-interacting

Stability

Invisible decays alter expansion history $\tau_{\text{DM}} \gtrsim 5 \times 10^{18} \text{ sec}$

Visible decays impact CMB spectra $\tau_{\text{DM}} \gtrsim 10^{25-29} \text{ sec}$

$$\tau_H \simeq 4 \times 10^{17} \text{ sec}$$

What dark matter cannot be

Reproduce the relic density

“Statistical” bounds on the mass

Charge neutrality

Cold relics

Not too-much self-interacting

Enough long-lived

Standard Model

gravity

Dark Matter

**We will see
plausible options
this week**
