A disclaimer

I **don't really believe** what I will say here has much chance of being correct. It is an attempt to answer some questions which I do believe deserves answering, and is based on an attempt at answering them. **and it gives a definite experimental signature at the EiC!** **if this is found** I'll give many talks like this, if not I'll forget it!

A very short detour into philosophy...

Science is done via two basic mechanisms...

Puzzle-solving within a paradigm using accepted assumptions to draw conclusions (Nowadays, just drop system into a ML/Bayesian code and wait!)

Paradigm shifts questioning the assumptions and trying to look for new ones (Humans are still useful here!)

Switching typically happens when the "weight of the puzzles" becomes too much and someone finds a set of assumptions that makes them go away

Introduction

Elliptic flow
Scaling of ν_2

The GLR-MQ
evolution equation

Results

Conclusions

Elliptic flow ν_2 (Harmonic flow ν_n)

Figure: A geometrical view of elliptic flow.

Elliptic flow is parametrized as the $n = 2$ Fourier component in the p_T distribution of the produced particles:

$$\frac{dN}{dp_T dy d\phi} = \frac{dN}{dp_T dy} \left[1 + \sum_{n=1}^{\infty} 2\nu_n(p_T) \cos(\phi - \phi_{0n}) \right] \quad (1)$$

A "dust"
Particles ignore each other, their path is independent of initial shape

A "fluid"
Particles continuously interact. Expansion determined by density gradient (shape)

Observable:

$$\frac{dN}{p_T dp_T dy d\phi} = \frac{dN}{p_T dp_T dy} [1 + 2v_n(p_T, y) \cos(n(\phi - \phi_0(n, p_T, y)))]$$

"Collectivity" Same v_n appears in \forall n-particle correlations , $\left\langle \frac{dN}{d\phi_1} \frac{dN}{d\phi_2} \dots \right\rangle$

People like this description because...

It fits quite a lot of data with reasonable precision (but also a lot of parameters:EoS, transport,initial conditions,....

The interpretation is reasonable, connects to fundamental science consistently, people “expect it” in some limit

It’s considered as a given. Details are now best sorted out via Bayesian fitting/ML

Scaling of ν_2

The GLR-MQ evolution equation

Results

Conclusions

My issue is that scalings in energy,rapidity and system size of v_n look suspiciously simple compared to the Hydrodinamical picture.

Buckingham's theorem (How to do hydro, circa 19th century, before ML!)

Any quantitative law of nature expressible as a formula

$$f(x_1, x_2, \dots, x_n) = 0$$

can be expressed as a dimensionless formula

$$F(\pi_1, \pi_2, \dots, \pi_{n-k}) = 0$$

where

$$\pi_i = \prod x_j^{\lambda_j} \quad , \quad \sum \lambda_j = 0$$

Widely applied within hydrodynamics in the 19th century: Knudsen's number, Reynolds number, Rayleigh's number, etc.

Since we are varying a whole slew of experimental $(y, p_T, N_{part}, \sqrt{s}, A)$ And theoretical

$(T, \mu, \eta, s, \hat{q}, \tau_0, \tau_{life})$ parameters it would be nice to represent heavy ion observables this way

How should ν_2 scale in hydrodynamics?

(Buckingham's theorem vs ν_2)

- Approximately it $\propto \epsilon$ since $\nu_2(\epsilon = 0) = 0$ and ϵ small and dimensionless
- Approximately it $\propto c_s$ since it is sensitive to EoS, $\nu_2(c_s = 0) = 0$ and c_s small, dimensionless
- It is maximum for ideal hydro. Since Kn small and dimensionless, $\nu_2 \sim \nu_2^{ideal}(1 - Kn)$. The Knudsen number is $Kn \sim \eta/(sTR)$
- $\nu_2^{ideal} \sim \nu_2(\tau \rightarrow \infty) \times f(\tau_f/\tau_0)$. $f(\dots)$ a monotonically increasing saturating,
 $\sim f(\langle p_T \rangle) \tanh(\dots)$ in Cooper-Frye. τ_f is the freezeout time.
- $\tau_f/\tau_0 \sim (e_0/e_f)^{4\alpha} \sim (T_0/T_f)^\alpha$, with $\frac{1}{3}|_{bjorken} < \alpha < \frac{4}{3}|_{hubble}$
 $T_0/T_f \sim ((1/(\tau_0 T_f S))(dN/dy))^{1/3}$ For constant T_f
Heiselberg-Levy scaling recovered

Figure: Elliptic flow v_2 vs. rapidity [2,3].

v_2 response in region where temperature dramatically changes remarkably smooth, follows dN/dy exactly (as far as we can tell). EoS, η/s shouldn't.

PbPb

pPb

size effects also remarkably absent, down to pp .

Remember that hydro expansion around small

Knudsen number, $Kn \sim \eta/(R \times s \times T)$.

we should scan this, but we don't seem to!

Introduction

Elliptic flow
Scaling of ν_2

The GLR-MQ
evolution equation

Results

Conclusions

Especially when you consider cumulants,
“hydrodynamics” seems remarkably independent of
number of constituents. Even if one does not consider
mean free path, what about thermodynamic
fluctuations?

Furthermore, rise in v_2 seems entirely due to rise in $\langle p_T \rangle$
 ! $v_2(p_T)$ nearly constant

Introduction

Elliptic flow
Scaling of v_2

The GLR-MQ
evolution equation

Results

Conclusions

In rapidity, v_2 of small systems above hydro prediction!
Perhaps limiting fragmentation together with p_T scaling with multiplicity could explain the trend. But this is not hydrodynamics, nor an explanation.

Cooper-Frye

$$v_2(p_T) = \int d\phi \cos(2\phi) \left(E - p_T \left(\frac{dt}{dr} + \Delta \frac{dt}{dr}(\phi) \right) \right) e \left(- \frac{\gamma(E - p_T(u_T + \delta u_T(\phi)))}{T} \right)$$

$$\simeq \int d\phi \cos^2(2\phi) \left[\underbrace{e^{-\frac{\gamma(E - p_T u_T)}{T}}}_{=0} - \underbrace{p_T \Delta \frac{dt}{dr}}_{\epsilon p_T} + \underbrace{\frac{\gamma \delta u_T(\phi) p_T}{T}}_{\sim \frac{\delta v_T}{T} p_T \sim \epsilon p_T / T} + \mathcal{O}(\epsilon^2, Kn) \right]$$

As long as $\frac{\delta v_T}{T} \sim \epsilon f(R, \sqrt{s})$ deviations $\sim p_T$, more prominent at @high p_T

Azimuthal correlations in hadronic collisions from instabilities of the initial state

UNIVERSIDADE ESTADUAL DE CAMPINAS

Introduction

Elliptic flow
Scaling of v_2

The GLR-MQ evolution equation

Results

Conclusions

Putting everything together we have

$$v_n(p_T) \simeq \mathcal{O}(1) \epsilon_n \underbrace{F(p_T)}_{\text{universal}}, \quad \langle v_n \rangle \sim \epsilon_n \underbrace{F(\langle p_T \rangle)}_{\langle p_T \rangle \sim \frac{1}{S} \frac{dN}{dy}}$$

For a non-linear theory such as hydrodynamics we do not expect matrix below to be sparse.

$$\begin{pmatrix} dN/dy \\ \langle p_T \rangle \\ v_n \end{pmatrix} = \underbrace{\begin{pmatrix} \dots & \dots & \dots \\ \dots & \dots & \dots \\ \dots & \dots & \dots \end{pmatrix}}_{\eta/S, c_S, \tau_\pi, \dots} \times \underbrace{\begin{pmatrix} T_{\text{initial}} \\ L \\ \epsilon_n \end{pmatrix}}_{\rightarrow N_{\text{part}}, A, \sqrt{s}}$$

So $v_2(A, \sqrt{s}, N_{\text{part}}, y, \dots)$ **non-separable** !

Analytical solutions (Hatta, Noronha, Xiao, GT) confirm this

Introduction

Photon vs hadron v_n

Azimuthal correlations in hadronic collisions from instabilities of the initial state

UNIVERSIDADE ESTADUAL DE CAMPINAS

PHENIX, 1105.4126v2 (PRL)

Figure: Photon v_3 vs. p_T (red) and Proton v_3 vs. p_T (black) [6]. Direct photon v_2 similar! Why are they the same at low p_T ?

Introduction

Elliptic flow
Scaling of v_2

The GLR-MQ
evolution equation

Results

Conclusions

All these puzzles have (satisfactory?) explanations within the "standard model"

photons contaminated by final-state decays, boosted
by **magnetic field based** mechanisms (**But**
why same as hadrons?)

small systems origin of v_n in small, large systems
different (CGC/antennae) **but why small**
and large systems scale?

$v_2(p_T)$ vs \sqrt{s} many effects cancel out

All these are plausible, but not so elegant!

Parton distributions

Let's see Deep Inelastic Scattering

$$\frac{dN}{d^3p} = \int f(Q_1, x_1, \theta_1) f(Q_2, x_2, \theta_2) \sigma_{gg \rightarrow j}(xQ_1 - xQ_2, \theta_1 - \theta_2) D_{j \rightarrow i}(z) [xQ_1 - xQ_2]^2 dx_{1,2} dQ_{1,2} dz$$

The *probability* that the struck parton carries a fraction x_{Bj} of the proton momentum is called *parton distribution function* $f(x, Q)$. Same in eA, AA collisions. This is initial state (all reinteractions “renormalized”)

Azimuthal correlations in hadronic collisions from instabilities of the initial state

UNIVERSIDADE ESTADUAL DE CAMPINAS

Introduction

Elliptic flow
Scaling of ν_2

The GLR-MQ evolution equation

Results

Conclusions

Bjorken scaling

Structure functions (PDFs, eventually GPDs) depend on the scale they are measured; i.e. x and Q^2 . In the perturbative limit dependence on Q^2 is subleading.

As $p_T \sim Q$ and $\eta \sim \ln(\frac{1}{x})$, then scaling of elliptic flow in HIC may resemble Bjorken scaling when adding an angular dependence on the structure functions.

Azimuthal correlations in hadronic collisions from instabilities of the initial state

UNIVERSIDADE ESTADUAL DE CAMPINAS

Introduction

Elliptic flow
Scaling of ν_2

The GLR-MQ evolution equation

Results

Conclusions

Let us entertain a crazy idea

What if parton distribution functions became azimuthally asymmetric, but still kept the running we expect from QCD???

v_2 of Photons as expected, v_n would be an initial state effect!

Scaling in x, Q exactly as expected from Bjorken-like running

Particle species protected by unitarity of the fragmentation function

But there is a reason I called it crazy: PDFs are universal and QCD is azimuthally symmetric!

Azimuthal correlations in hadronic collisions from instabilities of the initial state

UNIVERSIDADE ESTADUAL DE CAMPINAS

Introduction

Elliptic flow
Scaling of v_2

The GLR-MQ evolution equation

Results

Conclusions

Could structure functions be azimuthally asymmetric?

- Sivers functions (spin difference gives you an asymmetry) But uncorrelated with geometry, special role for v_2 so unlikely
- "Color antennae" and such (CGC models, Kovner et al, Gyulassy, Biro,...) Since antenna point in random directions, **effect always goes away for large systems ("many antennae")** I think scaling implies Same origin for pA, AA

Could structure functions be azimuthally asymmetric?

Azimuthal correlations in hadronic collisions from instabilities of the initial state

UNIVERSIDADE ESTADUAL DE CAMPINAS

Introduction

Elliptic flow

Scaling of ν_2

The GLR-MQ evolution equation

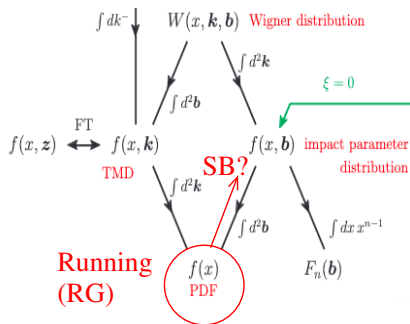

Results

Conclusions

The running of $f(x, Q)$ is really an RG equation, $f(x, Q)$ probe dependent at subleading order in α_s . At $\mathcal{O}(\alpha_s^2 \epsilon_n) \ll \nu_n$ (2nd and higher Twist) they should generally be azimuthally asymmetric for extended probes. **Can this small effect be amplified?**

RG, symmetry breaking and nucleon maps

Azimuthal correlations in hadronic collisions from instabilities of the initial state

UNIVERSIDADE ESTADUAL DE CAMPINAS

Introduction

Elliptic flow

Scaling of ν_2

The GLR-MQ evolution equation

Results

Conclusions

$$\frac{Q}{2} \frac{\partial}{\partial Q} \frac{\partial x G(x, Q^2)}{\partial \ln(1/x)} = \frac{\alpha_s N_c}{\pi} x G(x, Q^2)$$

$G(x, Q)$ evolve according to renormalization-group type linear operator evolution equations (DGLAP in Q , BFKL in x) But in x evolution blows up. This evolution breaks Froissart's bound (unitarity in hadron-hadron scattering) at low x .

In order to correct this, a non-linear term is added.

The GLR-MQ evolution equation

In the dense parton limit, the equation that governs the evolution of parton distribution functions inside hadrons is thought to be given by

$$\frac{Q}{2} \frac{\partial}{\partial Q} \frac{\partial x G(x, Q^2)}{\partial \ln(1/x)} = \frac{\alpha_s N_c}{\pi} x G(x, Q^2) - \frac{\alpha_s^2 N_c \pi}{2 C_F S_{\perp}} \frac{1}{Q^2} [x G(x, Q^2)]^2 \quad (2)$$

(It is a high Q limit of an integro-differential (GLR) equation).

Balancing the linear and the non-linear term defines the saturation scale Q_s , assuming azimuthal symmetry

Saturation together with an RG picture for saturation
generates JIMWLK action, CGC (**JIMWLK/CGC result** :
Azimuthally symmetric action, asymmetric
boundary conditions

But non-linear 2+1 differential equation *can have instabilities* breaking the underlying symmetry!

CAMPINAS

Introduction

Elliptic flow
Scaling of ν_2

The GLR-MQ
evolution equation

Results

Conclusions

Our proposal

Adding an angular dependence the GLR-MQ equation and keeping the same limits modify the equations the following way

$$\frac{xQ}{2} \left(\frac{\partial}{\partial Q} + \frac{1}{Q} \frac{\partial}{\partial \phi} \right) \frac{\partial}{\partial x} [xG(x, Q^2, \phi)] = \frac{\alpha_s N_c}{\pi} xG(x, Q^2, \phi)$$

$$- \frac{\alpha_s^2 N_c \pi}{2 C_F S_\perp} \frac{1}{Q^2} [xG(x, Q^2, \phi)]^2$$

(NB: angular ladder effects neglected as a first attempt, will modify this qualitative estimate)

As a solution, we try

$$G(x, Q^2, \phi) = G_0(x, Q^2) \left(1 + \sum_{n=1}^{\infty} u_n(x, Q^2) \cos(n\phi + \beta_n) \right),$$

$G_0(x, Q^2)$ is the azimuthally symmetric solution (i.e. saturation)

Azimuthal symmetry as a broken symmetry

Results

Conclusions

Equations for the Fourier coefficients

Working on the limiting case $Q \ll Q_s(x)$, we insert the solution with azimuthal perturbations into eq. fully asymmetric GLR-MQ equation and get three linear equations for our Fourier coefficients.

- 1 An infinite set of equations equation that relate the Fourier coefficients with the phases.

$$\sum_k u_k^2(x, Q^2) \cos(2\beta_k) = 0 \quad (3)$$

2 An infinite set of equations regarding only the derivative with respect to x .

$$x \frac{\partial u_n(x, Q^2)}{\partial x} = -(2\lambda + 1) u_n(x, Q^2)$$

$$+ \frac{N_c \pi}{2 C_F S_\perp \alpha_s^2} \frac{1}{Q^2} x^{2\lambda+1} \frac{1}{n} \left[\sum_k^{n-1} u_k(x, Q^2) u_{n-k}(x, Q^2) \sin(\beta_n - \beta_k - \beta_{n-k}) \right.$$

$$\left. + 2 \sum_k u_k(x, Q^2) u_{n+k}(x, Q^2) \sin(\beta_n + \beta_k - \beta_{n+k}) \right] \quad (4)$$

3 An infinite set of equations that regards derivatives with respect to Q and mixed terms.

$$\begin{aligned}
 (2\lambda+1)\frac{Q}{2}\frac{\partial u_n(x, Q^2)}{\partial Q} + \frac{Q}{2}x\frac{\partial^2 u_n(x, Q^2)}{\partial Q \partial x} &= \frac{\alpha_s N_c}{\pi} u_n(x, Q^2) \\
 + \frac{N_c \pi}{2C_F S_\perp \alpha_s^2} \frac{1}{Q^2} x^{2\lambda+1} &\left[2u_n(x, Q^2) \right. \\
 + \frac{1}{2} \sum_k^{n-1} u_k(x, Q^2) u_{n-k}(x, Q^2) \cos(\beta_n - \beta_k - \beta_{n-k}) \\
 + \sum_k u_k(x, Q^2) u_{n+k}(x, Q^2) \cos(\beta_n + \beta_k - \beta_{n+k}) &\left. \right] \quad (5)
 \end{aligned}$$

As an ansatz we propose

$$u_n(x, Q^2) = \delta_{n,2} \sum_{k=0}^{\infty} A_k \frac{(Bx^C)^k}{k!} Q^{D-2k} \quad (6)$$

then solve the equation linearized in u_k from initial conditions

$$u_n(\ln x^{-1} \rightarrow 0, Q) \sim \epsilon_n \alpha_s^2$$
