#### Motivations/context

- 2 Vector meson coupling to constituent quark axial current Quark-antiquark interaction- dynamical calculation Relation to  $g_A$  and form factor
- Quark-antiquark mesons + sea-quarks in improved NJL model Quark polarization in the NJLmodel - FSB A calculation on U(5) NJL Pion strangeness content leading to Meson Mixing Quark-antiquark states of light scalars

#### 4 Summary

\* Few slides presented in the talk have been withdrawn.

• = • • = • •

## I: Hadrons and NJL model: valence + sea quarks

(Low energy) QCD effective models: **global hadron properties** \* Dynamical Chiral Symmetry Breaking:  $\langle \bar{q}q \rangle$  masses/couplings

\* Some models "Near-exausted" (?) resources: still phenomenology and test-model

Nambu-Jona-Lasinio (NJL) model: low energy QCD/Quark model  $\sim$  punctual interactions  $G_0 \sim 1/M_G^2$  or  $1/\Lambda^2$  valence quarks Usually improvements rely on further free parameters

Strangeness content of nucleon (electromag.  $\sim$  5%) Charm content of nucleon: Brodsky, Hoyer, Peterson/many (1%) LHCb-NNPDF: evidence  $3\sigma$  c.l. (?)

Outcome → quarks/meson mixings: sea quarks \* Flavor symmetry breaking (FSB)

\* Spin content of the nucleon (hadrons) from axial current \* Pion and axial mesons (unstables) to nucleon: axial charge (nucleon or constituent quark)

\* Roughly: **axial mesons** as chiral partners ( $\rho - A_1$  and  $\omega - f_1$ ) \* Non-central collisions: vector mesons production

- Straightforward dynamical (one-loop polarization) calculation of **leading meson couplings to constituent quarks** *F.L.B., Phys. Rev. D105, 054009 (2022); Phys. Rev. (2019); E (2023) Journ. of Phys. G47, 115102 (2020); Phys. Rev. D97, 0140022 (2018) ; D101, 039902(E) (2020)* 

\* Vector mesons probe/couples to axial current

\* If yes, Even a photon could probe the axial current (by VMD)

< ロ > < 同 > < 三 > < 三

# Vector mesons couplings to axial current (dynamically generated)

$$\begin{aligned} & Z[\eta,\bar{\eta}] &= N \int \mathcal{D}[\bar{\psi},\psi] \\ & \exp i \int d^4x \quad \left[ \bar{\psi} \left( i \not{D} - m \right) \psi - \frac{g^2}{2} \int_{\mathcal{Y}} j^{\beta}_{\mu}(x) \tilde{R}^{\mu\nu}_{\beta\alpha}(x-y) j^{\alpha}_{\nu}(y) + \bar{\psi}\eta + \bar{\eta}\psi \right] \end{aligned}$$

color quark current  $j_{\alpha}^{\mu} = \bar{\psi} \lambda_{\alpha} \gamma^{\mu} \psi$ ,  $i, j, k = 0, ...(N_{f}^{2} - 1)$  for U( $N_{f} = 2$ ),  $\alpha, \beta... = 1, ...(N_{c}^{2} - 1)$ 

Fierz transformation  $\rightarrow$  all flavor-Dirac channels Auxiliary fields: suitable for quark-antiquark states

FabioLBraghin

## Leading couplings: meson- constituent quarks

Expansion of quark determinant (some ambiguities-symmetries)

Leading meson-constituent quark couplings (form factors)

$$\mathcal{L}_{j_{A}} = \left[ G_{A}(Q,K)Q_{\mu}\pi^{i}(Q) + G_{\bar{A}}(Q,K)\bar{A}_{\mu}^{i}(Q) \right] j_{A,i}^{\mu}(K,Q), \\ \mathcal{L}_{\nu-q} = g_{r1}(Q,K)V_{i}^{\mu}(Q)j_{\mu}^{V,i}(K,Q) + g_{A1}(Q,K)\bar{A}_{i}^{\mu}(Q)j_{\mu}^{A,i}(K,Q) \\ + g_{\nu1}(Q,K)V^{\mu}(Q)j_{\mu}(K,Q) + g_{f1}(Q,K)\bar{A}_{\mu}(Q)j_{\mu}^{\mu}(K,Q),$$
(1)

 $G_A(Q, K), g_{r1}(Q, K), g_{A1}(Q, K), g_{f1}(Q, K)$  are one loop integrals Coupling constants (K = Q = 0) or ( $Q^2 = M_{\pi}^2$ ) .. Numerically: correct order of magnitude (renormalization=1-fit)

FabioLBraghin

Quark determinant: Emergence of Gluon and pion clouds

- \* Gluon cloud: dressing to quark currents  $\rightarrow$  constituent quarks
- \* Pion cloud from the *Goldstone boson* couplings to (all) quark currents

\* Last part of the talk: Flavor symmetry breaking  $\rightarrow$  emergence of diverse sea quark "cloud"

## Wess Zumino Witten type coupling

#### Next leading terms

Note that: Meson-quark momenta Transversal to each other and Transversal meson polarization

For isosinglet  $V_{\mu}$  and isotriplet  $V_{\mu}^{i}$  mesons

$$\mathcal{L}_{\nu j a} = i \delta_{i j} \epsilon^{\sigma \rho \mu \nu} F^{\nu j a}(K, Q) K_{\sigma} \mathcal{F}^{i}_{\rho \mu}(Q) j^{A, j}_{\nu}(K, K+Q) + i \epsilon^{\sigma \rho \mu \nu} F^{\nu j a}(K, Q) K_{\sigma} \mathcal{F}_{\rho \mu}(Q) j^{A}_{\nu}(K, K+Q), \qquad (2)$$
$$j^{A, i}_{\mu}(K, K+Q) = \bar{\psi}(K+Q) \gamma_{\mu} \gamma_{5} \sigma^{i} \psi(K) \text{ and } j^{A}_{\mu}(K, K+Q) = \bar{\psi}(K+Q) \gamma_{\mu} \gamma_{5} \psi(K).$$

#### \* Polarized vector meson, transversal directions in $\epsilon^{\sigma \rho \mu \nu}$

$$\mathcal{F}^i_{
ho\mu}(Q)=Q_
ho\,V^i_\mu(Q)-Q_\mu\,V^i_
ho(Q),\qquad \mathcal{F}_{
ho\mu}(Q)=Q_
ho\,V_\mu(Q)-Q_\mu\,V_
ho(Q).$$

Poetic - May 2023

9/39

FabioLBraghin

For isosinglet  $\bar{A}_{\mu}$  and isotriplet  $\bar{A}^{i}_{\mu}$  mesons

$$\mathcal{L}_{\nu j a - A} = i \epsilon^{\sigma \rho \mu \nu} F^{\nu j a}(K, Q) K_{\sigma} \mathcal{G}^{i}_{\rho \mu}(Q) j^{V, i}_{\nu}(K, K + Q) + i \epsilon^{\sigma \rho \mu \nu} F^{\nu j a}(K, Q) K_{\sigma} \mathcal{G}_{\rho \mu}(Q) j^{V}_{\nu}(K, K + Q),$$
(3)

 $j_{\mu}^{V,i}(K,K+Q) = \overline{\psi}(K+Q)\gamma_{\mu}\sigma^{i}\psi(K)$  $j_{\mu}^{V}(K,K+Q) = \overline{\psi}(K+Q)\gamma_{\mu}\psi(K).$ 

$$\mathcal{G}^{i}_{\mu\nu} = \partial_{\mu}\bar{A}^{i}_{\nu} - \partial_{\nu}\bar{A}^{i}_{\mu}, \qquad \mathcal{G}_{\mu\nu} = \partial_{\mu}\bar{A}_{\nu} - \partial_{\nu}\bar{A}_{\mu}.$$
(4)

## Axial pion coupling and the $\rho$ coupling

Couplings to the axial current (out of 8 structures Ball-Chiu)

$$\begin{aligned} \mathcal{L}_{j_{A}} &= \left[ G_{A} Q_{\mu} \pi^{i}(Q) + G_{\bar{A}} \bar{A}^{i}_{\mu}(Q) + i F_{\nu j a} \epsilon_{\mu \nu \rho \sigma} K^{\nu} Q^{\rho} V^{\sigma}_{i}(Q) \right] \\ &\times j^{\mu}_{A,i}(K,Q), \end{aligned}$$

From the same method:

$$\frac{F_{vja}(K,Q)}{G_A(K,Q)} = \frac{1}{4M^*F} = \text{constant.}$$
(6)

Renormalization condition can be  $G_A \sim 1$ .

(Relativistic Consituent quark model - S.Weinberg + GT relation)

$$\frac{F_{vja}(K,Q) \times |K||Q|}{G_V(K,Q)} \Big|_{Q \sim K \sim 200-500 MeV} \sim 0.1.$$
(7)

*What happens at high energies?* Can a Photon probe the axial current (Vector Meson Dominance)?

FabioLBraghin

5)

11/39

## Witten's procedure: quantization

 $\mathcal{L}_{\textit{vja}}$  as a 5dim closed surface (Stoke's theorem)

$$n \Gamma = -\epsilon^{\sigma \rho \mu \nu} \frac{i}{240\pi^2} \int d^4 K \ d^4 Q \ F^{\nu j a}(K, Q) K_{\sigma} \mathcal{F}^i_{\rho \mu}(Q) j^{A,i}_{\nu}(K, K+Q),$$
(8)  
*n* is an integer:  $\Gamma = \epsilon_{\sigma \rho \mu \nu} \Gamma^{\sigma \rho \mu \nu}$ 

Quantized integrals (Sum over  $\mu\nu\rho\sigma$ ) contain integrals of the type

$$\begin{split} \Gamma_{(xyz0)} &= -\frac{i}{240\pi^2} \int d^4 K \ d^4 Q \ F^{vja}(K,Q) K_x Q_y \\ \times & \left[ \rho_z^-(Q) \bar{u}(K+Q) \gamma_0 \gamma_5 d(K) + \rho_z^+(Q) \bar{d}(K+Q) \gamma_0 \gamma_5 u(K) \right] (9) \\ \star \rho_z^{\pm}(Q) = z \text{-polarization component} \end{split}$$

From the last slide (one loop - rainbow ladder):

$$\frac{F_{vja}(K,Q)}{G_A(K,Q)} = \frac{1}{4M^*F}.$$
(10)

\* Sum of  $\Gamma_{\sigma\rho\mu\nu} \rightarrow$  "sum rule"?

イロト (得) (ヨ) (ヨ) - ヨ

Figure: Form factor  $G_{vja}(K, Q)$  for effective gluon propagator (Tandy-Maris) as a function  $Q^2$  for different values of K. Two effective masses  $M^* = 0.33$ GeV and  $M^* = 0.45$  GeV.

#### II Improved- NJL model

æ

< 2 > < 2 >

\* Nambu-Jona-Lasinio model:

$$\mathcal{L} = \bar{\psi}(i\partial \!\!\!/ - m_f)\psi + \frac{G_0}{2}[(\bar{\psi}\lambda_i\psi)^2 + (\bar{\psi}i\gamma_5\lambda_i\psi)^2]$$

\* Gluon exchange(s) and dynamics  $G_0 \sim \frac{1}{M_G^2}, \frac{1}{\Lambda^2}$  (flavorless) \* Current light quark masses  $m_f$  and generation of mass  $M_f = m_f + G_0 < \bar{q}q >_f$ 

\* Light meson multiplets (pseudoscalar, vector) reasonably well

\*  $\eta - \eta'$  puzzle -  $U_A(1)$  anomaly - 't Hooft interaction \* Vacuum polarization also generates U(3) 'tHooft int. for NJLmodel (without instantons) A.P.J., F.L.B., PRD90, 014049 (2014)

< ロ > < 同 > < 三 > < 三 > 、

#### Quark model pseudoscalar mesons nonet

Non degenerate quarks:  $|u\rangle$ ,  $|d\rangle$ ,  $|s\rangle$ 

$$\frac{P_a\lambda_a}{\sqrt{2}} = \begin{pmatrix} \frac{P_u}{\sqrt{2}} & \pi^+ & K^+ \\ \pi^- & \frac{P_d}{\sqrt{2}} & K^0 \\ K^- & K_0 & \frac{P_s}{\sqrt{2}} \end{pmatrix}$$

$$P_{1,2,3} \rightarrow \text{pions}$$

$$P_{4,5,6,7} \rightarrow \text{kaons}$$

$$P_{8} = \pi_{8} = \frac{1}{\sqrt{3}}(\bar{u}u + \bar{d}d - 2\bar{s}s) \rightarrow \eta$$

$$P_{0} = \pi_{0} = \frac{\sqrt{2}}{\sqrt{3}}(\bar{u}u + \bar{d}d + \bar{s}s) \rightarrow \eta'$$
(11)

< 口 > < 同

∃ >

Two reasons for improved NJL model (flavor symmetry breaking)

\*\* Usually mean field NJL model for fixed G<sub>0</sub>:
1) Gap equations for DChSB, one-loop
1) Mesons from Bound state equations, one-loop

\*\* QCD Lagrangian: flavor symmetry breaking in *m<sub>f</sub>* 2) in a "GOOD" effective model, this flavor breaking SHOULD be present in all parameters.. (EFT, Weinberg "theorem" 1979)

- \* So, one step further \*\*
- One loop level for the coupling constant calculated
- NJL coupling constant with flavor symmetry breaking

## Quark-polarization: fundamental and NJL model

Figure: Polarization in the NJL model, solid lines are quarks, P = 0

Figure: Wiggly lines with a dot = (dressed) gluon propagator.\* The dots in the vertices = running quark-gluon coupling constant.\* Need to (re)normalize resulting strength of interactions..

#### Resulting interaction *G<sub>ij</sub>*: flavor-dependent

FabioLBraghin

19/39

#### Gap/Bound state equations/ $G \rightarrow$ coupled equations

One obtains (that plugs into the BSE)  $i, j = 0, ... N_f^2 - 1$ :

$$G_{ij} = G_{ij}(M_u^*, M_d^*, M_s^*).$$
 (12)

Standard NJL gap equations f = u, d, s (U(3) flavor)

$$(G_0) \quad M_f - m_f = G_0 \operatorname{Tr}(S_{0,f}(0)) \tag{13}$$

By neglecting ALL mixing interactions  $G_{i\neq j}$  and  $G_{f_1\neq f_2}$ 

$$(G_{ij}) \quad M_f^* - m_f = G_{ff} Tr(S_{0,f}(0)). \tag{14}$$

with  $S_{0f}(k) = 1/(k - M^*)$ Chiral condensates  $\rightarrow$  sea quark-antiquark degrees of freedom

Coupled equations:  $G_{ij}$  and  $M_f^*$  perturbatively/self consistently

To fix parameters of the model (to fit observables), meson masses ,

## First and second mixings: Coupling constants

Coupling constants in the fundamental representation (quarks)  $G_{ff}$ Different from the ones of adjoint representation (mesons)  $G_{ij}$ 

$$2G_{uu} = 2\frac{G_{00}}{3} + G_{33} + \frac{G_{88}}{3},$$
  

$$2G_{dd} = 2\frac{G_{00}}{3} + G_{33} + \frac{G_{88}}{3},$$
  

$$2G_{ss} = 2\frac{G_{00}}{3} + 4\frac{G_{88}}{3},$$
(15)

where  $G_{88}(M_f^*), G_{00}(M_f^*)$  (for f = u, d, s) Emergence of sea quarks in GAP eqs. (1-quark mixings) *Screening* in coupling constants  $G_{ff}$  above

And resulting mixing interations (2- meson mixing interactions)

$$G_{i \neq j} \propto (M_{f_1} - M_{f_2})^{n=1,2}$$
  $G_{f_1 \neq f_2} \propto (M_{f_1} - M_{f_2})^{n=1,2}$ 

By neglecting ALL mixing interactions  $G_{i\neq j}$  - uncoupled equations:

$$1 - 2G_{ij}I_{f_1f_2}^{ij}(P_0^2 = -M_\phi^2, \vec{P}^2 = 0) = 0, \tag{16}$$

rest frame of meson  $\phi$ , eg, pseudoscalar mesons (NG)

 $G_{ij}$ : defines the meson structure in the adjoint representation Eg.

 $G_{11}, G_{22}, G_{33}$ : pion structure  $G_{44}, G_{55}, \dots$  kaon structure

$$I_{f_{1}f_{2}}^{ij}(P_{0},\vec{P}) = Tr_{D,F,C} \int \frac{d^{4}k}{(2\pi)^{4}} \lambda_{i} i\gamma_{5} S_{0,f_{1}}(k+P/2) \lambda_{j} i\gamma_{5} S_{0,f_{2}}(k-P/2), (17)$$

\* Since  $G_{ij}(M_u, M_d, M_s...)$  strange/heavier quark-antiquark states (sea) contribute for the pion...

\* Both fundamental and adjoint representations

\* F.L.B., Phys. Rev. D 103, 094028 (2021); J.Phys. G 49, 055101 (2022); arXiv:2212.06616; W.F.S.+F.L.B. arxiv: 2301.05695 arXiv:2301.10128

Table: Sets of parameters: Lagrangian quark masses, ultraviolet cutoff and the quark effective masses obtained from an initial NJL-gap equation  $G_0 = 10 \text{GeV}^{-2} \rightarrow \text{fitting procedure neutral } \pi^0, K^0$

## Pion strangeness content leading to Meson Mixing

Mixing matrix (Kroll, Feldmann et al)

$$\left(\begin{array}{c} \pi^{0} \\ \eta \\ \eta' \end{array}\right) = M \left(\begin{array}{c} P_{3} \\ P_{8} \\ P_{0} \end{array}\right)$$

Leading mixings:

$$\begin{aligned} |\eta \rangle &= \cos \theta_{ps} | P_8 \rangle - \sin \theta_{ps} | P_0 \rangle, \\ |\eta' \rangle &= \sin \theta_{ps} | P_8 \rangle + \cos \theta_{ps} | P_0 \rangle. \end{aligned} \tag{18}$$

$$\theta_{ps} = \frac{1}{2} \arcsin\left(\frac{4G_{08}^n \bar{G}_{08}}{(M_{\eta}^2 - M_{\eta'}^2)}\right).$$
(19)

Poetic - May 2023

34/39

$$\begin{aligned} |\eta > &= -(\epsilon_2 + \epsilon_1 \cos(\phi_{08})|P_3 > + \sqrt{\frac{2}{3}}\cos(\phi_{08})|P_8 >, \\ |\pi_0 > &= |P_3 > + \left(\sqrt{\frac{2}{3}}(\epsilon_1 + \epsilon_2\cos(\phi_{08})) - \frac{\epsilon_2 S_{\psi}}{\sqrt{3}}\right)|P_8 > . \end{aligned}$$

FabioLBraghin

 $\eta - \eta'$  mixing: usual basis

 $\pi^0 - \eta$  mixing:

$$|\pi^{0}\rangle = \frac{1}{\sqrt{2}}[1+a_{l}]|\bar{u}u\rangle - \frac{1}{\sqrt{2}}[1-a_{l}]|\bar{d}d\rangle - 2a_{s}|\bar{s}s\rangle,$$

\* Contributions for Up and down are different \*  $< \bar{q}q|\hat{H}|\bar{q}q > \simeq 2M_q \sim 900$  MeV.

$$\Delta_\eta m_{\pi^0} \simeq 4 a^2 M_s ~\sim~ 1-5~{
m MeV} ~~ \Delta_\eta M^*_{u,d} \sim rac{3}{4} \Delta_\eta m_{\pi^0}.$$

\* Meson -constituent quark couplings with mixings - on going

\* Similarly: ChPT - eg Kaiser, (2007)-  $\Delta_s M_\pi \sim 9-19$ MeV

#### Pion c-b content leading to mixing to $\eta_c$ , $\eta_b$

Flavor eigenstates 
$$P_3 = rac{1}{\sqrt{2}}(ar{u}u - ar{d}d) o \pi^0$$

$$P_{0} = \sqrt{\frac{2}{5}}(\bar{u}u + \bar{d}d + \bar{s}s + \bar{c}c + \bar{b}b) \rightarrow \eta'(958)$$

$$P_{8} = \frac{1}{\sqrt{3}}(\bar{u}u + \bar{d}d - 2\bar{s}s) \rightarrow \eta(548)$$

$$P_{15} = \frac{1}{\sqrt{6}}(\bar{u}u + \bar{d}d + \bar{s}s - 3\bar{c}c) \rightarrow \eta_{c}(3415)$$

$$P_{24} = \frac{1}{\sqrt{10}}(\bar{u}u + \bar{d}d + \bar{s}s + \bar{c}c - 4\bar{b}b) \rightarrow \eta_{b}(9859) \quad (20)$$

From the mixing:  $\pi^0 \sim P_3 + G_{30}P_0 + G_{38}P_8 + G_{3,15}P_{15} + G_{3,24}P_{24}$  such that mixing amplitude:

$$<\eta_{{\it c}}|\pi^0>\sim G_{\!3,15}, \qquad <\eta_{{\it b}}|\pi^0>\sim G_{\!3,24}$$

Problem to identify:  $M_{\pi^0} << M_{\eta_c} < M_{\eta_b}$  $\eta_c, \eta_b$  at rest  $\rightarrow$  pions  $K_{\pi^0} \sim (3375 MeV)$  (9719 MeV)?

## Quark-antiquark states of light scalars

#### Strong consequences of strangeness

Figure: Mesons  $A_0$  and  $\kappa$ : inversion of hierarchy

Figure: Ratio of mixings  $A_0 - f_0$  BESS-III: 0.4 or 0.97

$$R_{a0f0} \equiv rac{A_0^0(980) o S_8 o f_0(980)}{f_0(980) o S_3 o A_0^0(980)} \sim rac{\left|rac{a_{0,(8)}}{a_0}
ight|^2}{\left|rac{f_{0,(3)}}{f_0}
ight|^2} \equiv \left|rac{A_{8,a_0}}{A_{3,f_0}}
ight|^2.$$

FabioLBraghin

#### Summary

- Vector mesons may probe axial quark current ( $< r_{\rho} >_{A}^{2} )$
- FSB  $\rightarrow$  Mixing effects  $\rightarrow$  sea quark structures
- Meson mixings and strangeness/charm/bottom content

On going/planned:

- Flavor symmetry breaking/mixing effects in punctual vector effective interaction with B.El Bennich+F.Serna
- Flavor symmetry breaking/mixing effects in couplings, e.g. pion-constituent quarks and  $j_{A,\mu}$
- Behavior of FSB with increasing energies/momenta (GPDs,PDFs)
